

C++ ARRAY OF POINTERS

http://www.tutorialspoint.com/cplusplus/cpp_array_of_pointers.htm

Before we understand the concept of array of pointers, let us consider the following example, which makes use of an array of 3 integers:

```
#include <iostream>

using namespace std;
const int MAX = 3;

int main ()
{
    int var[MAX] = {10, 100, 200};

    for (int i = 0; i < MAX; i++)
    {
        cout << "Value of var[" << i << "] = ";
        cout << var[i] << endl;
    }
    return 0;
}
```

When the above code is compiled and executed, it produces the following result:

```
Value of var[0] = 10
Value of var[1] = 100
Value of var[2] = 200
```

There may be a situation, when we want to maintain an array, which can store pointers to an int or char or any other data type available. Following is the declaration of an array of pointers to an integer:

```
int *ptr[MAX];
```

This declares **ptr** as an array of MAX integer pointers. Thus, each element in ptr, now holds a pointer to an int value. Following example makes use of three integers which will be stored in an array of pointers as follows:

```
#include <iostream>

using namespace std;
const int MAX = 3;

int main ()
{
    int var[MAX] = {10, 100, 200};
    int *ptr[MAX];

    for (int i = 0; i < MAX; i++)
    {
        ptr[i] = &var[i]; // assign the address of integer.
    }
    for (int i = 0; i < MAX; i++)
    {
        cout << "Value of var[" << i << "] = ";
        cout << *ptr[i] << endl;
    }
    return 0;
}
```

When the above code is compiled and executed, it produces the following result:

```
Value of var[0] = 10  
Value of var[1] = 100  
Value of var[2] = 200
```

You can also use an array of pointers to character to store a list of strings as follows:

```
#include <iostream>  
  
using namespace std;  
const int MAX = 4;  
  
int main ()  
{  
    char *names[MAX] = {  
        "Zara Ali",  
        "Hina Ali",  
        "Nuha Ali",  
        "Sara Ali",  
    };  
  
    for (int i = 0; i < MAX; i++)  
    {  
        cout << "Value of names[" << i << "] = ";  
        cout << names[i] << endl;  
    }  
    return 0;  
}
```

When the above code is compiled and executed, it produces the following result:

```
Value of names[0] = Zara Ali  
Value of names[1] = Hina Ali  
Value of names[2] = Nuha Ali  
Value of names[3] = Sara Ali
```
