About the Tutorial

Google Web Toolkit (GWT) is a development toolkit for building and optimizing complex browser-based applications. GWT is used by many products at Google, including Google AdWords and Orkut.

GWT is an open source, completely free, and used by thousands of developers around the world. It is licensed under the Apache License version 2.0.

This tutorial will give you a great understanding of GWT concepts needed to get a web application up and running.

Audience

This tutorial is designed for software professionals who are willing to learn GWT programming in simple and easy steps. This will also give you great understanding on GWT Programming concepts.

After completing this tutorial, you will be at intermediate level of expertise from where you can take yourself at higher level of expertise.

Prerequisites

Before proceeding with this tutorial, you should have a basic understanding of Java programming language, text editor, and execution of programs, etc. Because we are going to develop web-based applications using GWT, it will be good if you have an understanding of other web technologies such as HTML, CSS, and AJAX.

What is GWT?

Google Web Toolkit (GWT) is a development toolkit to create **RICH Internet Applications (RIA)**. Here are some of its notable features:

- GWT provides developers option to write client-side applications in Java.
- GWT compiles the code written in JAVA to JavaScript code.
- Application written in GWT is cross-browser compliant. GWT automatically generates JavaScript code suitable for each browser.
- GWT is an open source, completely free, and used by thousands of developers around the world. It is licensed under the Apache License version 2.0.

Overall, GWT is a **framework** to build large-scale and high-performance web applications while making them easy-to-maintain.

Why to Use GWT?

Being Java based, you can use JAVA IDEs like Eclipse to develop a GWT application.

Developers can use code auto-complete/refactoring/navigation/project management and all features of IDEs. GWT which provides full debugging capability. Developers can debug the client side application just as a Java Application.

- GWT provides easy integration with Junit and Maven.
- Again being Java based, GWT has a low learning curve for Java Developers.
- GWT generates optimized JavaScript code, produces browser's specific JavaScript code by self.
- GWT provides widgets library which provides most of the tasks required in an application.
- GWT is extensible and custom widget based which can be created to cater to various application needs.

On top of everything, GWT applications can run on all major browsers and smart phones including Android and iOS based phones/tablets.
Disadvantages of GWT

Although GWT offers plenty of advantages, it suffers from the following disadvantages

- **Not Indexable**: Web pages generated by GWT would not be indexed by search engines because these applications are generated dynamically.

- **Not Degradable**: If your application user disables JavaScript then user will just see the basic page and nothing more.

- **Not Designer's Friendly**: GWT is not suitable for web designers who prefer using plain HTML with placeholders for inserting dynamic content at a later point in time.

The GWT Components

The GWT framework can be divided into the following three major parts

- **GWT Java to JavaScript compiler**: This is the most important part of GWT which makes it a powerful tool for building RIAs. The GWT compiler is used to translate all the application code written in Java into JavaScript.

- **JRE Emulation library**: Google Web Toolkit includes a library that emulates a subset of the Java runtime library. The list includes java.lang, java.lang.annotation, java.math, java.io, java.sql, java.util and java.util.logging

- **GWT UI building library**: This part of GWT consists of many subparts which includes the actual UI components, RPC support, History management, and much more.

GWT also provides a GWT Hosted Web Browser which lets you run and execute your GWT applications in hosted mode, where your code runs as Java in the Java Virtual Machine without compiling to JavaScript.
This tutorial will guide you on how to prepare a development environment to start your work with GWT Framework. This tutorial will also teach you how to setup JDK, Tomcat and Eclipse on your machine before you setup GWT Framework:

### System Requirement

GWT requires JDK 1.6 or higher so the very first requirement is to have JDK installed in your machine.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>JDK</strong></td>
<td>1.6 or above.</td>
</tr>
<tr>
<td><strong>Memory</strong></td>
<td>No minimum requirement.</td>
</tr>
<tr>
<td><strong>Disk Space</strong></td>
<td>No minimum requirement.</td>
</tr>
<tr>
<td><strong>Operating System</strong></td>
<td>No minimum requirement.</td>
</tr>
</tbody>
</table>

Follow the given steps to setup your environment to start with GWT application development.

### Step 1 – Verify Java Installation on Your Machine

Now open the console and execute the following java command.

<table>
<thead>
<tr>
<th>OS</th>
<th>Task</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>Open Command Console</td>
<td>c:&gt; java -version</td>
</tr>
<tr>
<td>Linux</td>
<td>Open Command Terminal</td>
<td>$ java -version</td>
</tr>
<tr>
<td>Mac</td>
<td>Open Terminal</td>
<td>machine:~ joseph$ java -version</td>
</tr>
</tbody>
</table>

Let's verify the output for all the operating systems
### Step 2 – Setup Java Development Kit (JDK)

If you do not have Java installed then you can install the Java Software Development Kit (SDK) from Oracle's Java site: [Java SE Downloads](https://www.oracle.com/java/). You will find instructions for installing JDK in downloaded files, follow the given instructions to install and configure the setup. Finally set PATH and JAVA_HOME environment variables to refer to the directory that contains java and javac, typically java_install_dir/bin and java_install_dir respectively.

Set the **JAVA_HOME** environment variable to point to the base directory location where Java is installed on your machine. For example

<table>
<thead>
<tr>
<th>OS</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>Set the environment variable JAVA_HOME to C:\Program Files\Java\jdk1.6.0_21</td>
</tr>
<tr>
<td>Linux</td>
<td>export JAVA_HOME=/usr/local/java-current</td>
</tr>
<tr>
<td>Mac</td>
<td>export JAVA_HOME=/Library/Java/Home</td>
</tr>
</tbody>
</table>

Append Java compiler location to System Path.

<table>
<thead>
<tr>
<th>OS</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>Append the string; %JAVA_HOME%\bin to the end of the system variable, Path.</td>
</tr>
</tbody>
</table>
Alternatively, if you use an Integrated Development Environment (IDE) like Borland JBuilder, Eclipse, IntelliJ IDEA, or Sun ONE Studio, compile and run a simple program to confirm that the IDE knows where you installed Java, otherwise do proper setup as given document of the IDE.

**Step 3 – Setup Eclipse IDE**

All the examples in this tutorial have been written using Eclipse IDE. Hence, suggest you to install the latest version of Eclipse on your machine based on your operating system.

To install Eclipse IDE, download the latest Eclipse binaries from [http://www.eclipse.org/downloads/](http://www.eclipse.org/downloads/). Once you downloaded the installation, unpack the binary distribution into a convenient location. For example in C:\eclipse on windows, or /usr/local/eclipse on Linux/Unix and finally set PATH variable appropriately.

Eclipse can be started by executing the following commands on windows machine, or you can simply double click on eclipse.exe

```
%C:\eclipse\eclipse.exe
```

Eclipse can be started by executing the following commands on UNIX (Solaris, Linux, etc.) machine:

```
$/usr/local/eclipse/eclipse
```

After a successful startup, if everything is fine then it should display following result:
Step 4 – Install GWT SDK & Plugin for Eclipse

Follow the instructions given at the link Plugin for Eclipse (incl. SDKs) to install GWT SDK & Plugin for Eclipse version installed on your machine.

After a successful setup for the GWT plugin, if everything is fine, then it should display the following screen which has Google icon marked in red rectangle as shown below:
Step 5: Setup Apache Tomcat

You can download the latest version of Tomcat from http://tomcat.apache.org/. Once you downloaded the installation, unpack the binary distribution into a convenient location. For example in C:\apache-tomcat-6.0.33 on windows, or /usr/local/apache-tomcat-6.0.33 on Linux/Unix and set CATALINA_HOME environment variable pointing to the installation locations.

Tomcat can be started by executing the following commands on windows machine, or you can simply double click on startup.bat

```
%CATALINA_HOME%\bin\startup.bat
```

or
```
/usr/local/apache-tomcat-6.0.33/bin/startup.sh
```

After a successful startup, the default web applications included with Tomcat will be available by visiting http://localhost:8080/. If everything is fine then it should display following result:
Further information about configuring and running Tomcat can be found in the documentation included here, as well as on the Tomcat web site: http://tomcat.apache.org

Tomcat can be stopped by executing the following commands on windows machine:

```
%CATALINA_HOME%\bin\shutdown
```
Or
```
C:\apache-tomcat-5.5.29\bin\shutdown
```

Tomcat can be stopped by executing the following commands on UNIX (Solaris, Linux, etc.) machine:

```
$CATALINA_HOME/bin/shutdown.sh
```
Or
```
/usr/local/apache-tomcat-5.5.29/bin/shutdown.sh
```
Before we start with creating actual "HelloWorld" application using GWT, let us see what the actual parts of a GWT application are:

A GWT application consists of following four important parts out of which last part is optional but first three parts are mandatory

- Module descriptors
- Public resources
- Client-side code
- Server-side code

Sample locations of different parts of a typical GWT HelloWorld application looks like the below:

<table>
<thead>
<tr>
<th>Name</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project root</td>
<td>HelloWorld/</td>
</tr>
<tr>
<td>Module descriptor</td>
<td>src/com/tutorialspoint/HelloWorld.gwt.xml</td>
</tr>
<tr>
<td>Public resources</td>
<td>src/com/tutorialspoint/war/</td>
</tr>
<tr>
<td>Client-side code</td>
<td>src/com/tutorialspoint/client/</td>
</tr>
<tr>
<td>Server-side code</td>
<td>src/com/tutorialspoint/server/</td>
</tr>
</tbody>
</table>

**Module Descriptors**

A module descriptor is the configuration file in the form of XML which is used to configure a GWT application.

A module descriptor file extension is *.gwt.xml, where * is the name of the application and this file should reside in the project's root.

Following will be the default module descriptor HelloWorld.gwt.xml for a HelloWorld application:

```xml
<?xml version="1.0" encoding="utf-8"?>
<module rename-to='helloworld'>
    <!-- inherit the core web toolkit stuff. -->
    <inherits name='com.google.gwt.user.user'/>

    <!-- inherit the default gwt style sheet. -->
</module>
```
<inherits name='com.google.gwt.user.theme.clean.Clean'/>

<!– specify the app entry point class. –>
<entry-point class='com.tutorialspoint.client.HelloWorld'/>

<!– specify the paths for translatable code –>
<source path='...'/>
<source path='...'/>

<!– specify the paths for static files like html, css etc. –>
<public path='...'/>
<public path='...'/>

<!– specify the paths for external javascript files –>
<script src="js-url" />
<script src="js-url" />

<!– specify the paths for external style sheet files –>
<stylesheet src="css-url" />
<stylesheet src="css-url" />

</module>

Following is a brief detail of different parts used in module descriptor

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Nodes &amp; Description</th>
</tr>
</thead>
</table>
| 1    | <module rename-to="helloworld">  
This provides name of the application. |
| 2    | <inherits name="logical-module-name" />This adds other gwt module in application just like import does in java applications. Any number of modules can be inherited in this manner. |
| 3    | <entry-point class="classname" />This specifies the name of class which will start loading the GWT Application. Any number of entry-point classes can be added and they are called sequentially in the order in which they appear in the module file. So when the onModuleLoad() of your first entry point finishes, the next entry point is called immediately. |
| 4    | <source path="path" />This specifies the names of source folders which GWT compiler will search for source compilation. |
The public path is the place in your project where static resources referenced by your GWT module, such as CSS or images, are stored. The default public path is the public subdirectory underneath where the Module XML File is stored.

Automatically injects the external JavaScript file located at the location specified by src.

Automatically injects the external CSS file located at the location specified by src.

Public Resources

These are the various files referenced by your GWT module, such as Host HTML page, CSS or images.

The location of these resources can be configured using <public path="path" /> element in module configuration file. By default, it is the public subdirectory underneath where the Module XML File is stored.

When you compile your application into JavaScript, all the files that can be found on your public path are copied to the module’s output directory.

The most important public resource is host page which is used to invoke actual GWT application. A typical HTML host page for an application might not include any visible HTML body content at all but it is always expected to include GWT application via a <script.../> tag as follows:

```html
<html>
<head>
<title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript" src="helloworld/helloworld.nocache.js">
    </script>
</head>
<body>

<h1>Hello World</h1>
<p>Welcome to first GWT application</p>

</body>
</html>
```
Following is the sample style sheet which we have included in our host page:

```
body {
   text-align: center;
   font-family: verdana, sans-serif;
}

h1 {
   font-size: 2em;
   font-weight: bold;
   color: #777777;
   margin: 40px 0px 70px;
   text-align: center;
}
```

### Client-side Code

This is the actual Java code written for implementing the business logic of the application and with this, GWT compiler translates into JavaScript, which will eventually run inside the browser. The location of these resources can be configured using `<source path="path" />` element in module configuration file.

For example, `EntryPoint` code will be used as client-side code and its location will be specified using `<source path="path" />`.

A module `entry-point` is any class that is assignable to `EntryPoint` and that can be constructed without parameters. When a module is loaded, every entry point class is instantiated and its `EntryPoint.onModuleLoad()` method gets called. A sample HelloWorld Entry Point class will be as follows:

```java
public class HelloWorld implements EntryPoint {
   public void onModuleLoad() {
      Window.alert("Hello, World!");
   }
}
```

### Server-side Code

This is the server side part of your application and it is very much optional. If you are not doing any backend processing within your application, then you do not need this part. However, if there is some processing required at backend and your client-side application interacts with the server, then you will have to develop these components.
The next chapter will make use of all the above-mentioned concepts to create a HelloWorld application using Eclipse IDE.
As the power of GWT lies in **Write in Java, Run in JavaScript**, we'll be using Java IDE Eclipse to demonstrate our examples.

Let's start with a simple *HelloWorld* application:

**Step 1 – Create Project**

The first step is to create a simple Web Application Project using Eclipse IDE. Launch project wizard using the option Google Icon ➔ New Web Application Project…. Now name your project as *HelloWorld* using the wizard window as follows:
Unselect **Use Google App Engine** because we're not using it in this project and leave other default values (keep the **Generate Sample project code** option checked as such and click Finish Button).

Once your project is created successfully, you will have the following content in your Project Explorer:

Here is a brief description of all the important folders

<table>
<thead>
<tr>
<th>Folder</th>
<th>Location</th>
</tr>
</thead>
</table>
| src    | Source code (java classes) files.  
Client folder containing the client-side specific java classes responsible for client UI display.  
Server folder containing the server-side java classes responsible for server side processing.  
Shared folder containing the java model class to transfer data from server to client and vice versa.  
HelloWorld.gwt.xml, a module descriptor file required for GWT compiler to compile the HelloWorld project.  
Test code (java classes) source files. |
<table>
<thead>
<tr>
<th><strong>Test</strong></th>
<th>Client folder containing the java classes responsible to test gwt client side code.</th>
</tr>
</thead>
</table>
| **War**  | This is the most important part, it represents the actual deployable web application.  
WEB-INF containing compiled classes, gwt libraries, servlet libraries.  
HelloWorld.css, project style sheet.  
HelloWorld.html, hots HTML which will invoke GWT UI Application. |

**Step 2 - Modify Module Descriptor: HelloWorld.gwt.xml**

GWT plugin will create a default module descriptor file src/com.tutorialspoint/HelloWorld.gwt.xml which is given below. For this example, we are not modifying it, but you can modify it later based on your requirement.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. You can change the theme of your GWT application by uncommenting any one of the following lines. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>
  <!-- <inherits name='com.google.gwt.user.theme.chrome.Chrome'/> -->
  <!-- <inherits name='com.google.gwt.user.theme.dark.Dark'/> -->

  <!-- Other module inherits -->

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
```
Step 3 - Modify Style Sheet: HelloWorld.css

GWT plugin will create a default Style Sheet file war/HelloWorld.css. Now, let us modify this file to keep our example simple and easier to understand.

```html
body {
  text-align: center;
  font-family: verdana, sans-serif;
}

h1 {
  font-size: 2em;
  font-weight: bold;
  color: #777777;
  margin: 40px 0px 70px;
  text-align: center;
}
```

Step 4 - Modify Host File: HelloWorld.html

GWT plugin will create a default HTML host file war/HelloWorld.html. Let us modify this file to keep our example simple and easier to understand.

```html
<html>
<head>
<title>Hello World</title>
  <link rel="stylesheet" href="HelloWorld.css"/>
  <script language="javascript"
  src="helloworld/helloworld.nocache.js">
  </script>
</head>
<body>
<h1>Hello World</h1>
<p>Welcome to first GWT application</p>
</body>
</html>
```
You can create more static files like HTML, CSS or images in the same source directory or you can create further sub-directories and move files in those sub-directories and configure those sub-directories in module descriptor of the application.

### Step 5 - Modify Entry Point: HelloWorld.java

GWT plugin will create a default Java file `src/com.tutorialspoint/HelloWorld.java`, which keeps an entry point for the application.

Let us modify this file to display "Hello,World!"

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.Window;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        Window.alert("Hello, World!");
    }
}
```

You can create more Java files in the same source directory to define either entry points or to define helper routines.

### Step 6 - Compile Application

Once you are ready with all the changes done, its time to compile the project. Use the option Google Icon 🌐 > GWT Compile Project... to launch GWT Compile dialogue box as shown below
Keep the default values intact and click Compile button. If everything goes fine, you will see following output in Eclipse console

```
Compiling module com.tutorialspoint.HelloWorld

    Compiling 6 permutations
    Compiling permutation 0...
    Compiling permutation 1...
    Compiling permutation 2...
    Compiling permutation 3...
    Compiling permutation 4...
    Compiling permutation 5...
    Compile of permutations succeeded

Linking into C:\workspace\HelloWorld\war\helloworld
    Link succeeded
    Compilation succeeded -- 33.029s
```

**Step 7 - Run Application**

Now click on Run application menu and select **HelloWorld** application to run the application.
If everything is fine, you must see GWT Development Mode active in Eclipse containing a URL as shown below. Double click the URL to open the GWT application.

Because you are running your application in development mode, you will also need to install GWT plugin for your browser. Simply follow the onscreen instructions to install the plugin.

If you already have GWT plugin set for your browser, then you should be able to see the following output

Congratulations! You have implemented your first application using Google Web Toolkit (GWT).
This tutorial will explain you how to create an application "war" file and how to deploy that in Apache Tomcat Webserver root.

If you understood this simple example, then you will also be able to deploy a complex GWT application following similar steps.

Now, let us have a working Eclipse IDE along with GWT plugin place and follow certain steps to create a GWT application:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify HelloWorld.gwt.xml, HelloWorld.css, HelloWorld.html and HelloWorld.java as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to make sure business logic is working as per the requirements.</td>
</tr>
<tr>
<td>4</td>
<td>Finally, zip the content of the war folder of the application in the form of war file and deploy it in Apache Tomcat Webserver.</td>
</tr>
<tr>
<td>5</td>
<td>Launch your web application using appropriate URL as explained below in the last step.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>  
</module>
```
<!-- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>

</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

body {
    text-align: center;
    font-family: verdana, sans-serif;
}

h1 {
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}

Following is the content of the modified HTML host file war/HelloWorld.html.

<html>
<head>
<title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript"
src="helloworld/helloworld.nocache.js">
    </script>
</head>
<body>

<h1>Hello World</h1>
<div id="gwtContainer"></div>

</body>
</html>
I modified the HTML a little bit from the previous example. Here I created a placeholder `<div>...</div>` where we will insert some content using our entry point java class. So let us have the following content of Java file `src/com.tutorialspoint/HelloWorld.java`.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.HTML;
import com.google.gwt.user.client.ui.RootPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        HTML html = new HTML("<p>Welcome to GWT application</p>");

        RootPanel.get("gwtContainer").add(html);
    }
}
```

Here we created a basic widget HTML and added it inside the div tag having the id="gwtContainer". We will study different GWT widgets in the coming chapters.

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in **GWT - Create Application** chapter. If everything is fine with your application, then this will produce the following result:
Create WAR File

Now our application is working fine and we are ready to export it as a war file.

Follow the following steps:

- Go into your project's war directory C:\workspace\HelloWorld\war
- Select all the files & folders available inside war directory.
- Zip all the selected files & folders in a file called HelloWorld.zip.
- Rename HelloWorld.zip to HelloWorld.war.

Deploy WAR file

- Stop the tomcat server.
- Copy the HelloWorld.war file to tomcat installation directory > webapps folder.
- Start the tomcat server.
- Look inside webapps directory, there should be a folder helloworld got created.
- Now HelloWorld.war is successfully deployed in Tomcat Webserver root.

Run the Application

Enter a url in the web browser: http://localhost:8080/HelloWorld to launch the application.

Server name (localhost) and port (8080) may vary as per your tomcat configuration.
GWT widgets rely on cascading style sheets (CSS) for visual styling. By default, the class name for each component is `gwt-classname`.

For example, the Button widget has a default style of `gwt-Button` and similar way the TextBox widget has a default style of `gwt-TextBox`.

In order to give all buttons and text boxes a larger font, you could put the following rule in your application's CSS file:

```css
.gwt-Button { font-size: 150%; }
gwt-TextBox { font-size: 150%; }
```

By default, neither the browser nor GWT creates default id attributes for widgets. You must explicitly create a unique id for the elements which you can use in CSS. In order to give a particular button with id `my-button-id` a larger font, you could put the following rule in your application's CSS file:

```css
#my-button-id { font-size: 150%; }
```

To set the id for a GWT widget, retrieve its DOM Element and then set the id attribute as follows:

```java
Button b = new Button();
DOM.setElementAttribute(b.getElement(), "id", "my-button-id")
```

**CSS Styling APIs**

There are many APIs available to handle CSS setting for any GWT widget. Following are few important APIs which will help you in your day to day web programming using GWT:

<table>
<thead>
<tr>
<th>S.No.</th>
<th>API &amp; Description</th>
</tr>
</thead>
</table>
| 1     | `public void setStyleName(java.lang.String style)`  
This method will clear any existing styles and set the widget style to the new CSS class provided using `style`. |
| 2     | `public void addStyleName(java.lang.String style)`  
This method will add a secondary or dependent style name to the widget. A secondary style name is an additional style name that is, so if there were any previous style names applied they are kept. |
public void removeStyleName(java.lang.String style)
This method will remove given style from the widget and leaves any others associated with the widget.

public java.lang.String getStyleName()
This method gets all of the object's style names, as a space-separated list.

public void setStylePrimaryName(java.lang.String style)
This method sets the object's primary style name and updates all dependent style names.

For example, let's define two new styles which we will apply to a text

```css
.gwt-Big-Text{
    font-size:150%;
}
gwt-Small-Text{
    font-size:75%;
}
gwt-Red-Text{
    color:red;
}
```

Now you can use `setStyleName(Style)` to change the default setting to new setting. After applying the following rule, a text's font will become large

```java
txtWidget.setStyleName("gwt-Big-Text");
```

We can apply a secondary CSS rule on the same widget to change its color as follows:

```java
txtWidget.addStyleName("gwt-Red-Text");
```

Using the above method, you can add as many styles as you like to apply on a widget. If you remove the first style from the button widget, then the second style will still remain with the text.

```java
txtWidget.removeStyleName("gwt-Big-Text");
```
Primary & Secondary Styles

By default, the primary style name of a widget will be the default style name for its widget class for example GWT-Button for Button widgets. When we add and remove style names using AddStyleName() method, those styles are called secondary styles.

The final appearance of a widget is determined by the sum of all the secondary styles added to it, plus its primary style. You set the primary style of a widget with the setStylePrimaryName(String) method. To illustrate, let's say we have a Label widget. In our CSS file, we have the following rules defined:

```
.MyText {
    color: blue;
}

.BigText {
    font-size: large;
}

.LoudText {
    font-weight: bold;
}
```

Let's suppose we want a particular label widget to always display blue text, and in some cases, use a larger, bold font for added emphasis.

We could do something like this:

```
// set up our primary style
Label someText = new Label();
someText.setStylePrimaryName("MyText");
...

// later on, to really grab the user's attention
someText.addStyleName("BigText");
someText.addStyleName("LoudText");
...

// after the crisis is over
someText.removeStyleName("BigText");
someText.removeStyleName("LoudText");

**Associating CSS Files**

There are multiple approaches for associating CSS files with your module. Modern GWT applications typically use a combination of CssResource and UiBinder. We are using only first approach in our examples.

- Using a `<link>` tag in the host HTML page.
- Using the `<stylesheet>` element in the module XML file.
- Using a `CssResource` contained within a `ClientBundle`.
- Using an inline `<ui:style>` element in a `UiBinder` template.

**GWT CSS Example**

This example will take you through simple steps to apply different CSS rules on your GWT widget. Let us have a working Eclipse IDE along with GWT plug in place and follow the following steps to create a GWT application:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <code>HelloWorld</code> under a package <code>com.tutorialspoint</code> as explained in the <strong>GWT - Create Application</strong> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <code>HelloWorld.gwt.xml</code>, <code>HelloWorld.css</code>, <code>HelloWorld.html</code> and <code>HelloWorld.java</code> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>
</module>
```
<!-- Specify the app entry point class. -->
<entry-point class='com.tutorialspoint.client.HelloWorld'/>

<!-- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>
</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

body{
    text-align: center;
    font-family: verdana, sans-serif;
}
h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}
gwt-Button{
    font-size: 150%;
    font-weight: bold;
    width:100px;
    height:100px;
}
gwt-Big-Text{
    font-size:150%;
}
gwt-Small-Text{
    font-size:75%;
}
Following is the content of the modified HTML host file `war/HelloWorld.html` to accommodate two buttons.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript" src="helloworld/helloworld.nocache.js"></script>
</head>
<body>
<div id="mytext"><h1>Hello, World!</h1></div>
<div id="gwtGreenButton"></div>
<div id="gwtRedButton"></div>
</body>
</html>
```

Let us have the following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will take care of adding two buttons in HTML and will apply custom CSS style.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.user.client.ui.Button;
import com.google.gwt.user.client.ui.HTML;
import com.google.gwt.user.client.ui.RootPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
```
// add button to change font to big when clicked.
Button Btn1 = new Button("Big Text");
Btn1.addClickHandler(new ClickHandler() {
    public void onClick(ClickEvent event) {
        RootPanel.get("mytext").setStyleName("gwt-Big-Text");
    }
});

// add button to change font to small when clicked.
Button Btn2 = new Button("Small Text");
Btn2.addClickHandler(new ClickHandler() {
    public void onClick(ClickEvent event) {
        RootPanel.get("mytext").setStyleName("gwt-Small-Text");
    }
});

RootPanel.get("gwtGreenButton").add(Btn1);
RootPanel.get("gwtRedButton").add(Btn2);

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, this will produce following result:
Now try clicking on the two buttons displayed and observe "Hello, World!" text which keeps changing its font upon clicking on the two buttons.
Every user interface considers the following three main aspects:

- **UI elements**: These are the core visual elements the user eventually sees and interacts with. GWT provides a huge list of widely used and common elements varying from basic to complex, which we will cover in this tutorial.

- **Layouts**: They define how UI elements should be organized on the screen and provide a final look and feel of the GUI (Graphical User Interface). This part will be covered in Layout chapter.

- **Behavior**: These are events which occur when the user interacts with UI elements. This part will be covered in Event Handling chapter.

**GWT UI Elements**

The GWT library provides classes in a well-defined class hierarchy to create complex web-based user interfaces. All classes in this component hierarchy has been derived from the `UIObject` base class as shown below:

Every Basic UI widget inherits properties from a Widget class which in turn inherits properties from UIObject. Tree and Menu will be covered in “Complex widgets” tutorial later.

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Widget &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GWT UIObject Class</td>
</tr>
</tbody>
</table>
|      | This widget contains text, not interpreted as HTML using a
<div>element, causing it to be displayed with block layout.

2  GWT Widget Class

This widget can contain HTML text and displays the html content using a <div> element, causing it to be displayed with block layout.

---

**GWT – UIObject Class**

**Introduction**

The class **UIObject** is the superclass for all user-interface objects. It simply wraps a DOM element, and cannot receive events. It provides direct child classes like Widget, MenuItem, MenuItemSeparator, TreeItem.

- All UIObject objects can be styled using CSS.
- Every UIObject has a primary style name that identifies the key CSS style rule that should always be applied to it.
- More complex styling behaviour can be achieved by manipulating an object's secondary style names.

**Class Declaration**

Following is the declaration for `com.google.gwt.user.client.ui.UIObject` class:

```java
public abstract class UIObject
    extends java.lang.Object
```

**Field**

Following are the fields for `com.google.gwt.user.client.ui.UIObject` class:

- **public static final java.lang.String DEBUG_ID_PREFIX** -- The element ID that you specify will be prefixed by the static string DEBUG_ID_PREFIX.

**Class Constructors**

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>UIObject()</td>
</tr>
<tr>
<td></td>
<td>This creates a UIObject for the child classes.</td>
</tr>
</tbody>
</table>
## Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Method &amp; Description</th>
</tr>
</thead>
</table>
| 1    | void addStyleDependentName(java.lang.String styleSuffix)  
Adds a dependent style name by specifying the style name's suffix. |
| 2    | void addStyleName(java.lang.String style)  
Adds a secondary or dependent style name to this object. |
| 3    | static void ensureDebugId(Element elem, java.lang.String id)  
Ensure that elem has an ID property set, which allows it to integrate with third-party libraries and test tools. |
| 4    | protected static void ensureDebugId(Element elem, java.lang.String baseID, java.lang.String id)  
Set the debug id of a specific element. |
| 5    | ensureDebugId(java.lang.String id)  
Ensure that the main Element for this UIObject has an ID property set, which allows it to integrate with third-party libraries and test tools. |
| 6    | int getAbsoluteLeft()  
Gets the object's absolute left position in pixels, as measured from the browser window's client area. |
| 7    | int getAbsoluteTop()  
Gets the object's absolute top position in pixels, as measured from the browser window's client area. |
| 8    | Element getElement()  
Gets a handle to the object's underlying DOM element. |
| 9    | int getOffsetHeight()  
Gets the object's offset height in pixels. |
<p>| 10   | int getOffsetWidth() |</p>
<table>
<thead>
<tr>

<td>void unsinkEvents(int eventBitsToRemove) Removes a set of events from this object's event list.</td>
<td></td>
</tr>
</tbody>
</table>

**Methods Inherited**

This class inherits methods from the following classes:

- java.lang.Object

---

**GWT – Widget Class**

**Introduction**

The class **Widget** is the base class for the majority of user-interface objects. Widget adds support for receiving events from the browser and being added directly to panels.

**Class Declaration**

Following is the declaration for **com.google.gwt.user.client.ui.Widget** class:

```java
public class Widget
```
extends UIObject

implements EventListener

Field
Following are the fields for com.google.gwt.user.client.ui.Widget class:

- public static final java.lang.String DEBUG_ID_PREFIX -- The element ID that you specify will be prefixed by the static string DEBUG_ID_PREFIX.

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Widget()</td>
</tr>
<tr>
<td></td>
<td>This creates a Widget for the child classes.</td>
</tr>
</tbody>
</table>

Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Method &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>protected &lt;H extends EventHandler&gt; HandlerRegistration addDomHandler(H handler, DomEvent.Type&lt;H&gt; type)</td>
</tr>
<tr>
<td></td>
<td>Adds a native event handler to the widget and sinks the corresponding native event.</td>
</tr>
<tr>
<td>2</td>
<td>protected &lt;H extends EventHandler&gt; HandlerRegistration addHandler(H handler, GwtEvent.Type&lt;H&gt; type)</td>
</tr>
<tr>
<td></td>
<td>Adds this handler to the widget.</td>
</tr>
<tr>
<td>3</td>
<td>protected void delegateEvent(Widget target, GwtEvent&lt;?&gt; event)</td>
</tr>
<tr>
<td></td>
<td>Fires an event on a child widget.</td>
</tr>
<tr>
<td>4</td>
<td>protected void doAttachChildren()</td>
</tr>
<tr>
<td></td>
<td>If a widget implements HasWidgets, it must override this method and call onAttach() for each of its child widgets.</td>
</tr>
<tr>
<td>5</td>
<td>protected void doDetachChildren()</td>
</tr>
</tbody>
</table>
If a widget implements HasWidgets, it must override this method and call `onDetach()` for each of its child widgets.

6. `void fireEvent(GwtEvent<?> event)`
   Fires the given event to all the appropriate handlers.

7. `protected int getHandlerCount(GwtEvent.Type<?> type)`
   Gets the number of handlers listening to the event type.

8. `Widget getParent()`
   Gets this widget's parent panel.

9. `boolean isAttached()`
   Determines whether this widget is currently attached to the browser's document (i.e., there is an unbroken chain of widgets between this widget and the underlying browser document).

10. `protected boolean isOrWasAttached()`
    Has this widget ever been attached?

11. `protected void onAttach()`
    This method is called when a widget is attached to the browser's document.

12. `void onBrowserEvent(Event event)`
    Fired whenever a browser event is received.

13. `protected void onDetach()`
    This method is called when a widget is detached from the browser's document.

14. `protected void onLoad()`
    Gets a handle to the object’s underlying DOM element.

15. `protected void onUnLoad()`
    This method is called immediately before a widget will be detached from the browser's document.
void removeFromParent()
Removes this widget from its parent widget.

void sinkEvents(int eventBitsToAdd)
Overridden to defer the call to super.sinkEvents until the first time this widget is attached to the dom, as a performance enhancement.

Methods Inherited
This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject

Basic Widgets
Following are few important Basic Widgets:

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Widget &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Label</td>
</tr>
<tr>
<td></td>
<td>This widget contains text, not interpreted as HTML using a &lt;div&gt; element, causing it to be displayed with block layout.</td>
</tr>
<tr>
<td>2</td>
<td>HTML</td>
</tr>
<tr>
<td></td>
<td>This widget can contain HTML text and displays the html content using a &lt;div&gt; element, causing it to be displayed with block layout.</td>
</tr>
<tr>
<td>3</td>
<td>Image</td>
</tr>
<tr>
<td></td>
<td>This widget displays an image at a given URL.</td>
</tr>
<tr>
<td>4</td>
<td>Anchor</td>
</tr>
<tr>
<td></td>
<td>This widget represents a simple &lt;a&gt; element.</td>
</tr>
</tbody>
</table>

GWT – Label Widget

Introduction
The Label can contains only arbitrary text and it can not be interpreted as HTML. This widget uses a <div> element, causing it to be displayed with block layout.

Class Declaration
Following is the declaration for com.google.gwt.user.client.ui.Label class:
public class Label
    extends Widget
    implements HasHorizontalAlignment, HasText, HasWordWrap,
                HasDirection, HasClickHandlers, SourcesClickEvents,
                SourcesMouseEvents, HasAllMouseHandlers

**Css Style Rules**

Following default CSS Style rule will be applied to all the labels. You can override it as per your requirements.

```
.gwt-Label { }
```

**Class Constructors**

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Label()</td>
</tr>
<tr>
<td></td>
<td>Creates an empty label.</td>
</tr>
<tr>
<td>2</td>
<td>protected Label(Element element)</td>
</tr>
<tr>
<td></td>
<td>This constructor may be used by subclasses to explicitly use an existing element.</td>
</tr>
<tr>
<td>3</td>
<td>Label(java.lang.String text)</td>
</tr>
<tr>
<td></td>
<td>Creates a label with the specified text.</td>
</tr>
<tr>
<td>4</td>
<td>Label(java.lang.String text, boolean wordWrap)</td>
</tr>
<tr>
<td></td>
<td>Creates a label with the specified text.</td>
</tr>
</tbody>
</table>

**Class Methods**

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Method &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>void addClickListener(ClickListener listener)</td>
</tr>
<tr>
<td></td>
<td>Adds a listener interface to receive click events.</td>
</tr>
<tr>
<td></td>
<td>Method</td>
</tr>
<tr>
<td>---</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>2</td>
<td><code>void addMouseListener(MouseListener listener)</code></td>
</tr>
<tr>
<td>3</td>
<td><code>void addMouseWheelListener(MouseWheelListener listener)</code></td>
</tr>
<tr>
<td>4</td>
<td><code>HasDirection.Direction getDirection()</code></td>
</tr>
<tr>
<td>5</td>
<td><code>HasHorizontalAlignment.HorizontalAlignmentConstant getHorizontalAlignment()</code></td>
</tr>
<tr>
<td>6</td>
<td><code>java.lang.String getText()</code></td>
</tr>
<tr>
<td>7</td>
<td><code>boolean getWordWrap()</code></td>
</tr>
<tr>
<td>8</td>
<td><code>void onBrowserEvent(Event event)</code></td>
</tr>
<tr>
<td>9</td>
<td><code>void removeClickListener(ClickListener listener)</code></td>
</tr>
<tr>
<td>10</td>
<td><code>void removeMouseListener(MouseListener listener)</code></td>
</tr>
<tr>
<td>11</td>
<td><code>void removeMouseWheelListener(MouseWheelListener listener)</code></td>
</tr>
<tr>
<td>12</td>
<td><code>void setDirection(HasDirection.Direction direction)</code></td>
</tr>
</tbody>
</table>
13 void setHorizontalAlignment(HasHorizontalAlignment.HorizontalAlignmentConstant align)
Sets the horizontal alignment.

14 void setText(java.lang.String text)
Sets this object's text.

15 void setWordWrap(boolean wrap)
Sets whether word-wrapping is enabled.

16 static Label wrap(Element element)
Creates a Label widget that wraps an existing <div> or <span> element.

**Methods Inherited**

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget

**Label Widget Example**

This example shows the usage of Label Widget in GWT. You can use the following steps to update the GWT application we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
    <!-- Inherit the core Web Toolkit stuff. -->
    <inherits name='com.google.gwt.user.User'/>
    
    <!-- Inherit the default GWT style sheet. -->
    <inherits name='com.google.gwt.user.theme.clean.Clean'/>
    
    <!-- Specify the app entry point class. -->
    <entry-point class='com.tutorialspoint.client.HelloWorld'/>
    
    <!-- Specify the paths for translatable code -->
    <source path='client'/>
    <source path='shared'/>
</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}

.gwt-Label{
    font-size: 150%;
    font-weight: bold;
    color:red;
}
```
Following is the content of the modified HTML host file `war/HelloWorld.html` to accommodate two buttons.

```html
<html>
<head>
<title>Hello World</title>
   <link rel="stylesheet" href="HelloWorld.css"/>
   <script language="javascript"
src="helloworld/helloworld.nocache.js">
   </script>
</head>
<body>

<h1>Label Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of Label widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.Label;
```
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        // create two Labels
        Label label1 = new Label("This is first GWT Label");
        Label label2 = new Label("This is second GWT Label");

        // use UIObject methods to set label properties.
        label1.setTitle("Title for first Lable");
        label1.addStyleName("gwt-Green-Border");
        label2.setTitle("Title for second Lable");
        label2.addStyleName("gwt-Blue-Border");

        // add labels to the root panel.
        VerticalPanel panel = new VerticalPanel();
        panel.add(label1);
        panel.add(label2);

        RootPanel.get("gwtContainer").add(panel);
    }
}
GWT - HTML Widget

Introduction
The HTML widget can contain arbitrary HTML which can be interpreted as HTML. This widget uses a <div> element, causing it to be displayed with block layout.

Class Declaration
Following is the declaration for `com.google.gwt.user.client.ui.Label` class:

```java
public class HTML
    extends Label
    implements HasHTML
```

Css Style Rules
Following default CSS Style rule will be applied to all the HTML widget. You can override it as per your requirements.

```css
.gwt-HTML {}
```
### Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>HTML()</td>
</tr>
<tr>
<td></td>
<td>Creates an empty HTML.</td>
</tr>
<tr>
<td>2</td>
<td>protected HTML(Element element)</td>
</tr>
<tr>
<td></td>
<td>This constructor may be used by subclasses to explicitly use an existing element.</td>
</tr>
<tr>
<td>3</td>
<td>HTML(java.lang.String html)</td>
</tr>
<tr>
<td></td>
<td>Creates a HTML with the specified html contents.</td>
</tr>
<tr>
<td>4</td>
<td>HTML(java.lang.String html, boolean wordWrap)</td>
</tr>
<tr>
<td></td>
<td>Creates an HTML widget with the specified contents, optionally treating it as HTML, and optionally disabling word wrapping.</td>
</tr>
</tbody>
</table>

### Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>java.lang.String getHTML()</td>
</tr>
<tr>
<td></td>
<td>Gets this object's contents as HTML.</td>
</tr>
<tr>
<td>2</td>
<td>void setHTML(java.lang.String html)</td>
</tr>
<tr>
<td></td>
<td>Sets this object's contents via HTML.</td>
</tr>
<tr>
<td>3</td>
<td>static HTML wrap(Element element)</td>
</tr>
<tr>
<td></td>
<td>Creates an HTML widget that wraps an existing &lt;div&gt; or &lt;span&gt; element.</td>
</tr>
</tbody>
</table>

### Methods Inherited

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.Label
- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.HasText
- java.lang.Object
**Html Widget Example**

This example will take you through simple steps to show usage of a HTML Widget in GWT. Follow the following steps to update the GWT application we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <em>com.tutorialspoint</em> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml</em>, <em>HelloWorld.css</em>, <em>HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`. 

```css
/*
 * HelloWorld.css
 */
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript" src="helloworld/helloworld.nocache.js"></script>
</head>
<body>
<h1>HTML Widget Demonstration</h1>
<div id="gwtContainer"></div>
</body>
</html>
```
Let us have following content of Java file **src/com.tutorialspoint/HelloWorld.java** which will demonstrate use of HTML widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.HTML;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        // create two HTML widgets
        HTML html1 = new HTML("This is first GWT HTML widget using <b> tag of html.");
        HTML html2 = new HTML("This is second GWT HTML widget using <i> tag of html.");

        // use UIObject methods to set HTML widget properties.
        html1.addStyleName("gwt-Green-Border");
        html2.addStyleName("gwt-Blue-Border");

        // add widgets to the root panel.
        VerticalPanel panel = new VerticalPanel();
        panel.setSpacing(10);
        panel.add(html1);
        panel.add(html2);

        RootPanel.get("gwtContainer").add(panel);
    }
}
```
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, this will produce following result:

![HTML Widget Demonstration](http://127.0.0.1:888/Hello World)

This is first GWT HTML widget using <b> tag of html.

This is second GWT HTML widget using <i> tag of html.

---

GWT – Image Widget

**Introduction**

The *Image* widget displays an image at a given URL. The image widget can be in 'unclipped' mode (the default mode) or 'clipped' mode. In clipped mode, a viewport is overlaid on top of the image so that a subset of the image will be displayed. In unclipped mode, there is no viewport - the entire image will be visible. Methods will operate differently depending on the mode that the image is in. These differences are detailed in the documentation for each method.

**Class Declaration**

Following is the declaration for `com.google.gwt.user.client.ui.Image` class:

```java
public class Image
    extends Widget
    implements SourcesLoadEvents, HasLoadHandlers,
                HasErrorHandlers, SourcesClickEvents,
                HasClickHandlers, HasAllMouseHandlers,
                SourcesMouseEvents
```
CSS Style Rules

Following default CSS Style rule will be applied to all the Image widget. You can override it as per your requirements.

```css
.gwt-Image {}
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Image()</td>
</tr>
<tr>
<td></td>
<td>Creates an empty image.</td>
</tr>
<tr>
<td>2</td>
<td>protected Image(Element element)</td>
</tr>
<tr>
<td></td>
<td>This constructor may be used by subclasses to explicitly use an existing element.</td>
</tr>
<tr>
<td>3</td>
<td>Image(java.lang.String url)</td>
</tr>
<tr>
<td></td>
<td>Creates an image with the specified url.</td>
</tr>
<tr>
<td>4</td>
<td>Image(java.lang.String html, int left, int top, int width, int height)</td>
</tr>
<tr>
<td></td>
<td>Creates a clipped image with a specified URL and visibility rectangle.</td>
</tr>
</tbody>
</table>

Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>void addClickListener(ClickListener listener)</td>
</tr>
<tr>
<td></td>
<td>Adds a listener interface to receive click events.</td>
</tr>
<tr>

<td><code>static void prefetch(java.lang.String url)</code>&lt;br&gt;Causes the browser to pre-fetch the image at a given URL.</td>
</tr>
<tr>
<td>12</td>
<td><code>void removeClickListener(ClickListener listener)</code>&lt;br&gt;This method is called immediately before a widget will be detached from the browser's document.</td>
</tr>
<tr>
<td>13</td>
<td><code>void removeLoadListener(LoadListener listener)</code>&lt;br&gt;Removes a previously added listener interface.</td>
</tr>
<tr>
<td>14</td>
<td><code>void removeMouseListener(MouseListener listener)</code>&lt;br&gt;Removes a previously added listener interface.</td>
</tr>
</tbody>
</table>
### Methods Inherited

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- java.lang.Object

### Image Widget Example

This example will take you through simple steps to show usage of an Image Widget in GWT.

Following are the steps to update a GWT application which we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
</tbody>
</table>
Compile and run the application to verify the result of the implemented logic.

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
 <!-- Inherit the core Web Toolkit stuff. -->
 <inherits name='com.google.gwt.user.User'/>

 <!-- Inherit the default GWT style sheet. -->
 <inherits name='com.google.gwt.user.theme.clean.Clean'/>

 <!-- Specify the app entry point class. -->
 <entry-point class='com.tutorialspoint.client.HelloWorld'/>

 <!-- Specify the paths for translatable code -->
 <source path='client'/>
 <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
}
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript"
src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>
<h1>Image Widget Demonstration</h1>
<div id="gwtContainer"></div>
</body>
</html>
```

Let us have the content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate the use of Image widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client EntryPoint;
import com.google.gwt.user.client.ui.Image;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        // Create a Image widget
```
Image image = new Image();

// set image source
image.setUrl("http://www.tutorialspoint.com/images/gwt-mini.png");

// Add image to the root panel.
VerticalPanel panel = new VerticalPanel();
panel.add(image);

RootPanel.get("gwtContainer").add(panel);
}
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, this will produce following result:
Introduction

The **Anchor** widget that represents a simple `<a>` element.

Class Declaration

Following is the declaration for `com.google.gwt.user.client.ui.Anchor` class:

```java
public class Anchor
    extends FocusWidget
    implements HasHorizontalAlignment, HasName,
                HasHTML, HasWordWrap, HasDirection
```

CSS Style Rules

Following default CSS Style rule will be applied to all the Image widget. You can override it as per your requirements.

```
.gwt-Anchor {}
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Anchor()</td>
</tr>
<tr>
<td></td>
<td>Creates an empty anchor.</td>

<tr>
<td></td>
<td>Sets this object's text.</td>
</tr>
</tbody>
</table>
GWT

18  void setWordWrap(boolean wrap)
Sets whether word-wrapping is enabled.

19  static Anchor wrap(Element element)
Creates an Anchor widget that wraps an existing <a> element.

Methods Inherited
This class inherits methods from the following classes:
- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.FocusWidget

Anchor Widget Example
This example will take you through simple steps to show usage of an Anchor Widget in GWT. Following are the steps to update the GWT application which we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor: src/com.tutorialspoint/HelloWorld.gwt.xml.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/> 
</module>
```
<!-- Inherit the default GWT style sheet. -->
<inherits name='com.google.gwt.user.theme.clean.Clean'/>

<!-- Specify the app entry point class. -->
<entry-point class='com.tutorialspoint.client.HelloWorld'/>

<!-- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>

</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}

Following is the content of the modified HTML host file war/HelloWorld.html.

<html>
<head>
<title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript"
        src="helloworld/helloworld.nocache.js">
    </script>
</head>
<body>
<h1>Anchor Widget Demonstration</h1>

<div id="gwtContainer"></div>

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client EntryPoint;
import com.google.gwt.user.client.ui Anchor;
import com.google.gwt.user.client.ui RootPanel;
import com.google.gwt.user.client.ui VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        // Create a Anchor widget,
        // pass text as TutorialsPoint
        // set asHtml as false,
        // href as www.tutorialspoint.com,
        // target as _blank
        Anchor anchor = new Anchor("TutorialsPoint",
                                   false,
                                   "http://www.tutorialspoint.com",
                                   "_blank");

        // Add anchor to the root panel.
        VerticalPanel panel = new VerticalPanel();
        panel.add(anchor);

        RootPanel.get("gwtContainer").add(panel);
    }
}
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of Anchor widget.
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, this will produce following result:
Form widgets allow users to input data and provides them interaction capability with the application. Every form widget inherits properties from Widget class which in turn inherits properties from UIObject and Widget classes.

<table>

<tr>
<td></td>
<td>This widget contains text, not interpreted as HTML using a &lt;div&gt; element, causing it to be displayed with block layout.</td>
</tr>
<tr>
<td>2</td>
<td>GWT Widget Class</td>
</tr>
<tr>
<td></td>
<td>This widget can contain HTML text and displays the html content using a &lt;div&gt; element, causing it to be displayed with block layout.</td>
</tr>
</tbody>
</table>

## GWT - UIObject Class

### Introduction

The class **UIObject** is the superclass for all user-interface objects. It simply wraps a DOM element, and cannot receive events. It provides direct child classes like Widget, MenuItem, MenuItemSeparator, TreeItem.

- All UIObject objects can be styled using CSS.
- Every UIObject has a primary style name that identifies the key CSS style rule that should always be applied to it.
- More complex styling behaviour can be achieved by manipulating an object's secondary style names.

### Class Declaration

Following is the declaration for `com.google.gwt.user.client.ui.UIObject` class:

```java
public abstract class UIObject
    extends java.lang.Object
```

### Field

Following are the fields for `com.google.gwt.user.client.ui.UIObject` class:
- **public static final java.lang.String DEBUG_ID_PREFIX** -- The element ID that you specify will be prefixed by the static string DEBUG_ID_PREFIX.

### Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>void addStyleDependentName(java.lang.String styleSuffix)</td>
</tr>
<tr>
<td>2</td>
<td>void addStyleName(java.lang.String style)</td>
</tr>
<tr>
<td>3</td>
<td>static void ensureDebugId(Element elem, java.lang.String id)</td>
</tr>
<tr>
<td>4</td>
<td>protected static void ensureDebugId(Element elem, java.lang.String baseID, java.lang.String id)</td>
</tr>
<tr>
<td>5</td>
<td>ensureDebugId(java.lang.String id)</td>
</tr>
<tr>
<td>6</td>
<td>int getAbsoluteLeft()</td>
</tr>
<tr>
<td>7</td>
<td>int getAbsoluteTop()</td>
</tr>
</tbody>
</table>

### Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Method &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>This creates a UIObject for the child classes.</td>
</tr>
<tr>
<td>2</td>
<td>Adds a secondary or dependent style name to this object.</td>
</tr>
<tr>
<td>3</td>
<td>Ensure that elem has an ID property set, which allows it to integrate with third-party libraries and test tools.</td>
</tr>
<tr>
<td>4</td>
<td>Set the debug id of a specific element.</td>
</tr>
<tr>
<td>5</td>
<td>Ensure that the main Element for this UIObject has an ID property set, which allows it to integrate with third-party libraries and test tools.</td>
</tr>
<tr>
<td>6</td>
<td>Gets the object's absolute left position in pixels, as measured from the browser window's client area.</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td>---</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| 8 | `Element getElement()`  
   Gets a handle to the object's underlying DOM element. |
| 9 | `int getOffsetHeight()`  
   Gets the object's offset height in pixels. |
| 10 | `int getOffsetWidth()`  
   Gets the object's offset width in pixels. |
| 11 | `protected Element getStyleElement()`  
   Template method that returns the element to which style names will be applied. |
| 12 | `java.lang.String getStyleName()`  
   Gets all of the object's style names, as a space-separated list. |
| 13 | `protected static java.lang.String getStyleName(Element elem)`  
   Gets all of the element's style names, as a space-separated list. |
| 14 | `java.lang.String getStylePrimaryName()`  
   Gets the primary style name associated with the object. |
| 15 | `protected static java.lang.String getStylePrimaryName(Element elem)`  
   Gets the element's primary style name. |
| 16 | `java.lang.String getTitle()`  
   Gets the title associated with this object. |
| 17 | `boolean isVisible()`  
   Determines whether or not this object is visible. |
<p>| 18 | <code>static boolean isVisible(Element elem)</code> |</p>
<table>
<thead>
<tr>
<th>Line</th>
<th>Method Call</th>
<th>Description</th>

<tr>
<td>32</td>
<td>void setTitle(java.lang.String title)</td>
<td>Sets the title associated with this object.</td>
</tr>
<tr>
<td>33</td>
<td>void setVisible(boolean visible)</td>
<td>Sets whether this object is visible.</td>
</tr>
<tr>
<td>34</td>
<td>static void setVisible(Element elem, boolean visible)</td>
<td>Sets whether this element is visible.</td>
</tr>
<tr>
<td>35</td>
<td>void setWidth(java.lang.String width)</td>
<td>Sets the object's width.</td>
</tr>
<tr>
<td>36</td>
<td>java.lang.String toString()</td>
<td>This method is overridden so that any object can be viewed in the debugger as an HTML snippet.</td>
</tr>
<tr>
<td>37</td>
<td>void unsinkEvents(int eventBitsToRemove)</td>
<td>Removes a set of events from this object's event list.</td>
</tr>
</tbody>
</table>

**Methods Inherited**

This class inherits methods from the following classes:

- java.lang.Object
GWT - Widget Class

Introduction

The class Widget is the base class for the majority of user-interface objects. Widget adds support for receiving events from the browser and being added directly to panels.

Class Declaration

Following is the declaration for com.google.gwt.user.client.ui.Widget class:

```
public class Widget
    extends UIObject
    implements EventListener
```

Field

Following are the fields for com.google.gwt.user.client.ui.Widget class:

- `public static final java.lang.String DEBUG_ID_PREFIX` -- The element ID that you specify will be prefixed by the static string DEBUG_ID_PREFIX.

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Widget()</td>
</tr>
<tr>
<td></td>
<td>This creates a Widget for the child classes.</td>
</tr>
</tbody>
</table>

Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Method &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>protected &lt;H extends EventHandler&gt; HandlerRegistration addDomHandler(H handler, DomEvent.Type&lt;H&gt; type)</code></td>
</tr>
<tr>
<td></td>
<td>Adds a native event handler to the widget and sinks the corresponding native event.</td>
</tr>
<tr>
<td>2</td>
<td><code>protected &lt;H extends EventHandler&gt; HandlerRegistration addHandler(H</code></td>
</tr>
</tbody>
</table>
handler, GwtEvent.Type<H> type)
Adds this handler to the widget.

3  protected void delegateEvent(Widget target, GwtEvent<?> event)
Fires an event on a child widget.

4  protected void doAttachChildren()
If a widget implements HasWidgets, it must override this method and call onAttach() for each of its child widgets.

5  protected void doDetachChildren()
If a widget implements HasWidgets, it must override this method and call onDetach() for each of its child widgets.

6  void fireEvent(GwtEvent<?> event)
Fires the given event to all the appropriate handlers.

7  protected int getHandlerCount(GwtEvent.Type<?> type)
Gets the number of handlers listening to the event type.

8  Widget getParent()
Gets this widget's parent panel.

9  boolean isAttached()
Determines whether this widget is currently attached to the browser's document (i.e., there is an unbroken chain of widgets between this widget and the underlying browser document).

10 protected boolean isOrWasAttached()
Has this widget ever been attached?

11 protected void onAttach()
This method is called when a widget is attached to the browser's document.

12 void onBrowserEvent(Event event)
Fired whenever a browser event is received.
protected void onDetach()
This method is called when a widget is detached from the browser's document.

protected void onLoad()
Gets a handle to the object's underlying DOM element.

protected void onUnload()
This method is called immediately before a widget will be detached from the browser's document.

void removeFromParent()
Removes this widget from its parent widget.

void sinkEvents(int eventBitsToAdd)
Overridden to defer the call to super.sinkEvents until the first time this widget is attached to the dom, as a performance enhancement.

Methods Inherited
This class inherits methods from the following classes:
- com.google.gwt.user.client.ui.UIObject

Form Widgets
Following are the few important Form Widgets:

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Widget &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Button</td>
</tr>
<tr>
<td></td>
<td>This widget represents a standard push button.</td>
</tr>
<tr>
<td>2</td>
<td>PushButton</td>
</tr>
<tr>
<td></td>
<td>This widget represents a normal push button with custom styling.</td>
</tr>
<tr>
<td>3</td>
<td>ToggleButton</td>
</tr>
<tr>
<td></td>
<td>This widget represents a stylish stateful button which allows the user to toggle between up and down states.</td>
</tr>
<tr>
<td>4</td>
<td>CheckBox</td>
</tr>
<tr>
<td></td>
<td>This widget represents a standard check box widget. This class also serves as a base class for RadioButton.</td>
</tr>
<tr>
<td>5</td>
<td>RadioButton</td>
</tr>
</tbody>
</table>
This widget represents a mutually-exclusive selection radio button widget.

6 Listing Box
This widget represents a list of choices to the user, either as a list box or as a drop-down list.

7 Suggest Box
This widget represents a text box or text area which displays a pre-configured set of selections that match the user's input. Each Suggest Box is associated with a single Suggest Oracle. The Suggest Oracle is used to provide a set of selections given a specific query string.

8 Text Box
This widget represents a single line text box.

9 Password Text Box
This widget represents a text box that visually masks its input to prevent eavesdropping.

10 Text Area
This widget represents a text box that allows multiple lines of text to be entered.

11 Rich Text Area
This widget represents a rich text editor that allows complex styling and formatting.

12 File Upload
This widget wraps the HTML <input type='file'> element.

13 Hidden
This widget represents a hidden field in an HTML form.

**GWT - Button Widget**

**Introduction**
The Button widget represents a standard push button.

**Class Declaration**
Following is the declaration for com.google.gwt.user.client.ui.Button class:
public class Button
    extends ButtonBase

CSS Style Rules
Following default CSS Style rule will be applied to all the Button widget. You can override it as per your requirements.

.gwt-Button {}

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Button()</td>
</tr>
<tr>
<td></td>
<td>Creates a button with no caption.</td>
</tr>
<tr>
<td>2</td>
<td>protected Button(Element element)</td>
</tr>
<tr>
<td></td>
<td>This constructor may be used by subclasses to explicitly use an existing element.</td>
</tr>
<tr>
<td>3</td>
<td>Button(java.lang.String html)</td>
</tr>
<tr>

<td>Creates a button with the given HTML caption.</td>
</tr>
<tr>
<td>4</td>
<td>Button(java.lang.String html, ClickListener listener)</td>
</tr>
<tr>
<td></td>
<td>Creates a button with the given HTML caption and click listener.</td>
</tr>
</tbody>
</table>

Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>click()</td>
</tr>
<tr>
<td></td>
<td>Programmatic equivalent of the user clicking the button.</td>
</tr>
<tr>
<td>2</td>
<td>static Button wrap(Element element)</td>
</tr>
<tr>
<td></td>
<td>Creates a Button widget that wraps an existing &lt;a&gt; element.</td>
</tr>
</tbody>
</table>
Methods Inherited

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.FocusWidget
- com.google.gwt.user.client.ui.ButtonBase
- java.lang.Object

Button Widget Example

This example will take you through simple steps to show usage of a Button Widget in GWT. Following steps will help you update the GWT application which we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify HelloWorld.gwt.xml, HelloWorld.css, HelloWorld.html and HelloWorld.java as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. --><inherits name='com.google.gwt.user.User'/>
  <!-- Inherit the default GWT style sheet. --><inherits name='com.google.gwt.user.theme.clean.Clean'/>
  <!-- Specify the app entry point class. --><entry-point class='com.tutorialspoint.client.HelloWorld'/>
</module>
```
Following is the content of the modified Style Sheet file war/HelloWorld.css.

```css
body{
  text-align: center;
  font-family: verdana, sans-serif;
}

h1{
  font-size: 2em;
  font-weight: bold;
  color: #777777;
  margin: 40px 0px 70px;
  text-align: center;
}

.gwt-Button{
  color:red;
}

.gwt-Green-Button{
  color:green;
}

.gwt-Blue-Button {
  color:blue;
}
```

Following is the content of the modified HTML host file war/HelloWorld.html.

```html
<html>
<head>
<title>Hello World</title>
</head>
</html>
```
Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of Button widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.Button;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {

        //create buttons
        Button redButton = new Button("Red");
        Button greenButton = new Button("Green");
        Button blueButton = new Button("Blue");

        // use UIObject methods to set button properties.
    }
}
```
redButton.setWidth("100px");
greenButton.setWidth("100px");
blueButton.setWidth("100px");
greenButton.addStyleName("gwt-Green-Button");
blueButton.addStyleName("gwt-Blue-Button");

//add a clickListener to the button
redButton.addClickHandler(new ClickHandler() {
    @Override
    public void onClick(ClickEvent event) {
        Window.alert("Red Button clicked!");
    }
});

//add a clickListener to the button
greenButton.addClickHandler(new ClickHandler() {
    @Override
    public void onClick(ClickEvent event) {
        Window.alert("Green Button clicked!");
    }
});

//add a clickListener to the button
blueButton.addClickHandler(new ClickHandler() {
    @Override
    public void onClick(ClickEvent event) {
        Window.alert("Blue Button clicked!");
    }
});

// Add button to the root panel.
VerticalPanel panel = new VerticalPanel();
panel.setSpacing(10);
panel.add(redButton);
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

![Image of Button Widget Demonstration]

When you click **Click Me** button, it will show an alert message saying **Hello World!**

**GWT - PushButton Widget**

**Introduction**

The **PushButton** widget represents a standard push button with custom styling.

**Class Declaration**

Following is the declaration for com.google.gwt.user.client.ui.PushButton class:
public class PushButton
    extends CustomButton

CSS Style Rules
Following default CSS Style rules will be applied to all the PushButton widget. You can override it as per your requirements.

```html
.gwt-PushButton-up {}
.gwt-PushButton-down {}
.gwt-PushButton-up-hovering {}
.gwt-PushButton-down-hovering {}
.gwt-PushButton-up-disabled {}
.gwt-PushButton-down-disabled {}
```

Class Constructors

<table>
<thead>
<tr>

<td>Called when the user finishes clicking on this button.</td>
</tr>
<tr>
<td>2</td>
<td>protected void onClickCancel()</td>
</tr>
<tr>
<td></td>
<td>Called when the user aborts a click in progress; for example, by dragging the mouse outside of the button before releasing the mouse button.</td>
</tr>
<tr>
<td>3</td>
<td>protected void onClickStart()</td>
</tr>
<tr>
<td></td>
<td>Called when the user begins to click on this button.</td>
</tr>
</tbody>
</table>

### Methods inherited

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.FocusWidget
- com.google.gwt.user.client.ui.CustomButton
- java.lang.Object

### PushButton Widget Example

This example will take you through simple steps to show usage of a PushButton Widget in GWT. The following steps will help you update the GWT application which we created in GWT - Create Application chapter:
<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <code>HelloWorld</code> under a package <code>com.tutorialspoint</code> as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <code>HelloWorld.gwt.xml</code>, <code>HelloWorld.css</code>, <code>HelloWorld.html</code> and <code>HelloWorld.java</code> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>  
  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>  
  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>  
  <!-- Specify the paths for translatable code -->
  <source path='client'/>  
  <source path='shared'/>  
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
  text-align: center;
  font-family: verdana, sans-serif;
}
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
</head>
</html>
```
Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of PushButton widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.PushButton;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        //create a push button
        PushButton pushButton = new PushButton("Click Me!");

        //create a push button
        PushButton pushButton1 = new PushButton("Click Me!");

        //disable a push button
```
pushButton1.setEnabled(false);

//add a clickListener to the push button
pushButton.addClickHandler(new ClickHandler() {
    @Override
    public void onClick(ClickEvent event) {
        Window.alert("Hello World!");
    }
});

// Add push buttons to the root panel.
VerticalPanel panel = new VerticalPanel();
panel.setSpacing(10);
panel.add(pushButton);
panel.add(pushButton1);
RootPanel.get("gwtContainer").add(panel);
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, this will produce the following result:
When you click on **Click Me!** button, it will show an alert message as **Hello World!**

You can see the color of button text and its state will change with your interaction.

- Hover over the button, color will be pink.
- Press the button, color will be aqua.
- Release the button, color will be green.

---

**GWT - ToggleButton Widget**

**Introduction**

The **ToggleButton** widget represents a stylish button which allows the user to toggle between up and down states.

**Class Declaration**

Following is the declaration for `com.google.gwt.user.client.ui.ToggleButton` class:

```java
public class ToggleButton extends CustomButton
```
**CSS Style Rules**

Following default CSS Style rules will be applied to all the ToggleButton widgets. However, you can override it as per your requirements.

```
.gwt-ToggleButton-up {}
.gwt-ToggleButton-down {}
.gwt-ToggleButton-up-hovering {}
.gwt-ToggleButton-down-hovering {}
.gwt-ToggleButton-up-disabled {}
.gwt-ToggleButton-down-disabled {}
```

**Class Constructors**

<table>
<thead>
<tr>
<th>S.N.</th>

</tr>
<tr>
<td></td>
<td>Creates a ToggleButton with up state text and clickListener.</td>
</tr>
</tbody>
</table>
ToggleButton(java.lang.String upText, java.lang.String downText)
Creates a ToggleButton with up state and down state text.

ToggleButton(java.lang.String upText, java.lang.String downText, ClickListener listener)
Creates a ToggleButton with up state, down state text and click listener.

### Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>boolean isDown()</td>
</tr>
<tr>
<td></td>
<td>Is this button down?</td>
</tr>
<tr>
<td>2</td>
<td>protected void onClick()</td>
</tr>
<tr>
<td></td>
<td>Called when the user finishes clicking on this button.</td>
</tr>
<tr>
<td>3</td>
<td>void setDown(boolean down)</td>
</tr>
<tr>
<td></td>
<td>Sets whether this button is down.</td>
</tr>
</tbody>
</table>

### Methods Inherited

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.FocusWidget
- com.google.gwt.user.client.ui.CustomButton
- java.lang.Object

### Togglebutton Widget Example

This example will take you through simple steps to show usage of a ToggleButton Widget in GWT. Follow the following steps to update the GWT application we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Create a project with a name <strong>HelloWorld</strong> under a package <em>com.tutorialspoint</em> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>2</td>
<td>Modify <strong>HelloWorld.gwt.xml</strong>, <strong>HelloWorld.css</strong>, <strong>HelloWorld.html</strong> and <strong>HelloWorld.java</strong> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
    <!-- Inherit the core Web Toolkit stuff. -->
    <inherits name='com.google.gwt.user.User'/>

    <!-- Inherit the default GWT style sheet. -->
    <inherits name='com.google.gwt.user.theme.clean.Clean'/>

    <!-- Specify the app entry point class. -->
    <entry-point class='com.tutorialspoint.client.HelloWorld'/>

    <!-- Specify the paths for translatable code -->
    <source path='client'/>
    <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript"
src="helloworld/helloworld.nocache.js">
```
Let us have following content of Java file src/com.tutorialspoint/HelloWorld.java which will demonstrate use of ToggleButton widget.

```java
public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {

        //create toggle buttons
        ToggleButton toggleButton = new ToggleButton("Click Me!");
        ToggleButton toggleButton1 = new ToggleButton("Click Me!");

        //disable a toggle button
        toggleButton1.setEnabled(false);

        //add a clickListener to the toggle button
        toggleButton.addClickHandler(new ClickHandler() {
            @Override
            public void onClick(ClickEvent event) {
                Window.alert("Hello World!");
            }
        });

        // Add toggle button to the root panel.
        VerticalPanel panel = new VerticalPanel();
        panel.setSpacing(10);
        panel.add(toggleButton);
    }
}
```
```java
panel.add(toggleButton1);

RootPanel.get("gwtContainer").add(panel);
}
```

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

![Image of the application running](image)

When you click **Click Me** button, it will show an alert message **Hello World!**
You can see color of button text will change with your interaction.

- Hover over the button, color will be pink.
- Press the button, color will be blue.
- Release the button, button will remain down.
GWT - CheckBox Widget

**Introduction**
The **CheckBox** widget represents a standard checkbox.

**Class Declaration**
Following is the declaration for `com.google.gwt.user.client.ui.CheckBox` class:

```java
public class CheckBox
    extends ButtonBase
    implements HasName
```

**Css Style Rules**
Following default CSS Style rules will be applied to all the CheckBox widget. You can override it as per your requirements.

```
.gwt-CheckBox {}
.gwt-CheckBox-disabled {}
```

**Class Constructors**

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CheckBox()</td>
</tr>
<tr>
<td></td>
<td>Constructor for CheckBox.</td>

</tr>
<tr>
<td>15</td>
<td>void setName(java.lang.String name) Sets the widget's name.</td>
</tr>
<tr>
<td>16</td>
<td>void setTabIndex(int index) Sets the widget's position in the tab index.</td>
</tr>
<tr>
<td>17</td>
<td>void setText(java.lang.String text) Sets this object's text.</td>
</tr>
<tr>
<td>18</td>
<td>void sinkEvents(int eventBitsToAdd) Adds a set of events to be sunk by this object.</td>
</tr>
<tr>
<td>19</td>
<td>java.lang.String getHTML() Gets this object's contents as HTML.</td>
</tr>
</tbody>
</table>

**Methods Inherited**

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.FocusWidget
- java.lang.Object
**CheckBox Widget Example**

This example will take you through simple steps to show usage of a CheckBox Widget in GWT. Follow the following steps to update the GWT application we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <code>HelloWorld</code> under a package <code>com.tutorialspoint</code> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <code>HelloWorld.gwt.xml</code>, <code>HelloWorld.css</code>, <code>HelloWorld.html</code> and <code>HelloWorld.java</code> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor *src/com.tutorialspoint/HelloWorld.gwt.xml*.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file *war/HelloWorld.css*.

```css
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
  <link rel="stylesheet" href="HelloWorld.css"/>
  <script language="javascript"
src="helloworld/helloworld.nocache.js">
  </script>
</head>
<body>

<h1>CheckBox Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```
Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of CheckBox widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.CheckBox;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {

        // Make a new check box, and select it by default.
        CheckBox checkBox1 = new CheckBox("Check Me!");
        CheckBox checkBox2 = new CheckBox("Check Me!");

        // set check box as selected
        checkBox1.setValue(true);

        //disable a checkbox
        checkBox2.setEnabled(false);

        checkBox1.addClickHandler(new ClickHandler() {
            @Override
            public void onClick(ClickEvent event) {
                CheckBox checkBox = (CheckBox)event.getSource();
                Window.alert("CheckBox is " +
                (checkBox.getValue() ? "" : "not") + " checked");
            }
        });
    }
}
```
// Add checkboxes to the root panel.
VerticalPanel panel = new VerticalPanel();
panel.setSpacing(10);
panel.add(checkBox1);
panel.add(checkBox2);

RootPanel.get("gwtContainer").add(panel);
}
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

When you click **Click Me** CheckBox, it will show an alert message saying **CheckBox** is checked or not checked.
GWT - RadioButton Widget

Introduction
The RadioButton widget represents a mutually exclusive selection radio button.

Class Declaration
Following is the declaration for com.google.gwt.user.client.ui.RadioButton class:

```java
public class RadioButton
    extends CheckBox
```

CSS Style Rules
Following default CSS Style rules will be applied to all the RadioButton widget. You can override it as per your requirements.

```css
.gwt-RadioButton {}
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>RadioButton(java.lang.String name)</td>
</tr>
<tr>
<td></td>
<td>Creates a new radio associated with a particular group name.</td>
</tr>
<tr>
<td>2</td>
<td>RadioButton(java.lang.String name,java.lang.String label)</td>
</tr>
<tr>
<td></td>
<td>Creates a new radio associated with a particular group, and initialized with the given HTML label.</td>
</tr>
<tr>
<td>3</td>
<td>RadioButton(java.lang.String name,java.lang.String label, boolean asHTML)</td>
</tr>
<tr>
<td></td>
<td>Creates a new button associated with a particular group, and initialized with the given label (optionally treated as HTML).</td>
</tr>
</tbody>
</table>

Class Methods
void setName(java.lang.String name)
Change the group name of this radio button.

Methods Inherited
This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.FocusWidget
- com.google.gwt.user.client.ui.CheckBox
- java.lang.Object

RadioButton Widget Example
This example will take you through simple steps to show usage of a RadioButton Widget in GWT. Follow the following steps to update the GWT application we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>

</tbody>
</table>

Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
    <!-- Inherit the core Web Toolkit stuff. -->
    <inherits name='com.google.gwt.user.User'/>

    <!-- Inherit the default GWT style sheet. -->
    <inherits name='com.google.gwt.user.theme.clean.Clean'/>```
<!-- Specify the app entry point class. -->
<entry-point class='com.tutorialspoint.client.HelloWorld'/>

<!-- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>

</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

body{
   text-align: center;
   font-family: verdana, sans-serif;
}
h1{
   font-size: 2em;
   font-weight: bold;
   color: #777777;
   margin: 40px 0px 70px;
   text-align: center;
}
gwt-RadioButton{
   color:green;
}

Following is the content of the modified HTML host file war/HelloWorld.html.

<html>
<head>
<title>Hello World</title>
   <link rel="stylesheet" href="HelloWorld.css"/>
   <script language="javascript"
src="helloworld/helloworld.nocache.js">
   </script>
</head>
Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of RadioButton widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client EntryPoint;
import com.google.gwt.user.client.ui.RadioButton;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {

        // Create some radio buttons, all in one group 'radioGroup'.
        RadioButton radioButton1 = new RadioButton("radioGroup", "First");
        RadioButton radioButton2 = new RadioButton("radioGroup", "Second");
        RadioButton radioButton3 = new RadioButton("radioGroup", "Third");

        // Check 'First' by default.
        radioButton1.setValue(true);

        //disable 'Second' radio button
        radioButton2.setEnabled(false);

        // Add toggle button to the root panel.
    }
}
```
VerticalPanel panel = new VerticalPanel();
panel.setSpacing(10);
panel.add(radioButton1);
panel.add(radioButton2);
panel.add(radioButton3);

RootPanel.get("gwtContainer").add(panel);
}
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

GWT - ListBox Widget

Introduction

The ListBox widget represents a list of choices to the user, either as a list box or as a drop-down list.
Class Declaration
Following is the declaration for `com.google.gwt.user.client.ui.ListBox` class:

```java
public class ListBox
    extends FocusWidget
    implements SourcesChangeEvents, HasName
```

Css Style Rules
Following default CSS Style rules will be applied to all the ListBox widget. You can override it as per your requirements.

```
.gwt-ListBox {}
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>listBox()</td>
</tr>
<tr>
<td></td>
<td>Creates an empty list box in single selection mode.</td>
</tr>
<tr>
<td>2</td>
<td>listBox(boolean isMultipleSelect)</td>
</tr>
<tr>
<td></td>
<td>Creates an empty list box.</td>
</tr>
<tr>
<td>3</td>
<td>listBox(Element element)</td>
</tr>
<tr>
<td></td>
<td>This constructor may be used by subclasses to explicitly use an existing element.</td>
</tr>
</tbody>
</table>

Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>void addItem(java.lang.String item)</td>
</tr>
<tr>
<td></td>
<td>Adds an item to the list box.</td>
</tr>
<tr>
<td>2</td>
<td>void addItem(java.lang.String item, java.lang.String value)</td>
</tr>
<tr>
<td></td>
<td>Adds an item to the list box, specifying an initial value for the item.</td>
</tr>
<tr>
<td></td>
<td>Method</td>
</tr>
<tr>
<td>---</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>3</td>
<td>void clear()</td>
</tr>
<tr>
<td>4</td>
<td>int getItemCount()</td>
</tr>
<tr>
<td>5</td>
<td>java.lang.String getItemText(int index)</td>
</tr>
<tr>
<td>6</td>
<td>java.lang.String getName()</td>
</tr>
<tr>
<td>7</td>
<td>int getSelectedIndex()</td>
</tr>
<tr>
<td>8</td>
<td>java.lang.String getValue(int index)</td>
</tr>
<tr>
<td>9</td>
<td>int getVisibleItemCount()</td>
</tr>
<tr>
<td>10</td>
<td>void insertItem(java.lang.String item, int index)</td>
</tr>
<tr>
<td>11</td>
<td>void insertItem(java.lang.String item, java.lang.String value, int index)</td>
</tr>
<tr>
<td>12</td>
<td>boolean isItemSelected(int index)</td>
</tr>
<tr>
<td>13</td>
<td>boolean isMultipleSelect()</td>
</tr>
<tr>
<td>14</td>
<td>void onBrowserEvent(Event event)</td>
</tr>
</tbody>
</table>
Fired whenever a browser event is received.

<table>
<thead>
<tr>
<th>Line</th>
<th>Method Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td><strong>protected void onEnsureDebugId(java.lang.String baseID)</strong>&lt;br&gt;Affected Elements: -item# = the option at the specified index.</td>
</tr>
<tr>
<td>16</td>
<td><strong>void removeChangeListener(ChangeListener listener)</strong>&lt;br&gt;Removes a previously added listener interface.</td>
</tr>
<tr>
<td>17</td>
<td><strong>void removeItem(int index)</strong>&lt;br&gt;Removes the item at the specified index.</td>
</tr>
<tr>
<td>18</td>
<td><strong>void setItemSelected(int index, boolean selected)</strong>&lt;br&gt;Sets whether an individual list item is selected.</td>
</tr>
<tr>
<td>19</td>
<td><strong>void setItemText(int index, java.lang.String text)</strong>&lt;br&gt;Sets the text at given index.</td>
</tr>
<tr>
<td>20</td>
<td><strong>void setMultipleSelect(boolean multiple)</strong>&lt;br&gt;Sets whether this list allows multiple selections.</td>
</tr>
<tr>
<td>21</td>
<td><strong>void setName(java.lang.String name)</strong>&lt;br&gt;Sets the widget's name.</td>
</tr>
<tr>
<td>22</td>
<td><strong>void setSelectedIndex(int index)</strong>&lt;br&gt;Sets the currently selected index.</td>
</tr>
<tr>
<td>23</td>
<td><strong>void setValue(int index, java.lang.String value)</strong>&lt;br&gt;Sets the value associated with the item at a given index.</td>
</tr>
<tr>
<td>24</td>
<td><strong>void setVisibleItemCount(int visibleItems)</strong>&lt;br&gt;Sets the number of items that are visible.</td>
</tr>
<tr>
<td>25</td>
<td><strong>static ListBox wrap(Element element)</strong>&lt;br&gt;Creates a ListBox widget that wraps an existing &lt;select&gt; element.</td>
</tr>
</tbody>
</table>
26  void addChangeListener(ChangeListener listener)

   Adds a listener interface to receive change events.

Methods Inherited

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.FocusWidget
- java.lang.Object

ListBox Widget Example

This example will take you through simple steps to show usage of a ListBox Widget in GWT. Follow the following steps to update the GWT application we created in \textit{GWT - Create Application} chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name \textit{HelloWorld} under a package \textit{com.tutorialspoint} as explained in the \textit{GWT - Create Application} chapter.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor \textit{src/com.tutorialspoint/HelloWorld.gwt.xml}.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
   <!-- Inherit the core Web Toolkit stuff. -->
   <inherits name='com.google.gwt.user.User'/>
</module>
```
Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}

.gwt-ListBox{
    color: green;
}
```

Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
</head>
```
Let us have following content of Java file src/com.tutorialspoint/HelloWorld.java which will demonstrate use of ListBox widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client EntryPoint;
import com.google.gwt.user.client.ui.ListBox;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {

        // Make a new list box, adding a few items to it.
        ListBox listBox1 = new ListBox();
        listBox1.addItem("First");
        listBox1.addItem("Second");
        listBox1.addItem("Third");
        listBox1.addItem("Fourth");
        listBox1.addItem("Fifth");
    }
}
// Make a new list box, adding a few items to it.
ListBox listBox2 = new ListBox();
listBox2.addItem("First");
listBox2.addItem("Second");
listBox2.addItem("Third");
listBox2.addItem("Fourth");
listBox2.addItem("Fifth");

// Make enough room for all five items
listBox1.setVisibleItemCount(5);

//setting itemcount value to 1 turns listbox into a drop-down list.
listBox2.setVisibleItemCount(1);

// Add listboxes to the root panel.
VerticalPanel panel = new VerticalPanel();
panel.setSpacing(10);
panel.add(listBox1);
panel.add(listBox2);
RootPanel.get("gwtContainer").add(panel);
}
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce following result:
GWT - SuggestionBox Widget

Introduction
The SuggestionBox widget represents a text box or text area which displays a pre-configured set of selections that match the user's input. Each SuggestBox is associated with a single SuggestOracle. The SuggestOracle is used to provide a set of selections given a specific query string.

Class Declaration
Following is the declaration for com.google.gwt.user.client.ui.SuggestionBox class:

```java
public final class SuggestBox
```
extends Composite

implements HasText, HasFocus, HasAnimation,
    SourcesClickEvents, SourcesFocusEvents,
    SourcesChangeEvents, SourcesKeyboardEvents,
    FiresSuggestionEvents

**Css Style Rules**

Following default CSS Style rules will be applied to all the ListBox widget. You can override it as per your requirements.

```
gwt-SuggestBox {
}
gwt-SuggestBoxPopup {
}
gwt-SuggestBoxPopup .item {
}
gwt-SuggestBoxPopup .item-selected {
}
gwt-SuggestBoxPopup .suggestPopupTopLeft {
}
gwt-SuggestBoxPopup .suggestPopupTopLeftInner {
}
gwt-SuggestBoxPopup .suggestPopupTopCenter {
}
gwt-SuggestBoxPopup .suggestPopupTopCenterInner {
}
gwt-SuggestBoxPopup .suggestPopupTopRight {
}
gwt-SuggestBoxPopup .suggestPopupTopRightInner {
}
gwt-SuggestBoxPopup .suggestPopupMiddleLeft {
}
gwt-SuggestBoxPopup .suggestPopupMiddleLeftInner {
}
gwt-SuggestBoxPopup .suggestPopupMiddleCenter {
}
gwt-SuggestBoxPopup .suggestPopupMiddleCenterInner {
}
gwt-SuggestBoxPopup .suggestPopupMiddleRight {
}
gwt-SuggestBoxPopup .suggestPopupMiddleRightInner {
}
gwt-SuggestBoxPopup .suggestPopupBottomLeft {
}
gwt-SuggestBoxPopup .suggestPopupBottomLeftInner {
}
gwt-SuggestBoxPopup .suggestPopupBottomCenter {
}
gwt-SuggestBoxPopup .suggestPopupBottomCenterInner {
}
gwt-SuggestBoxPopup .suggestPopupBottomRight {
}
gwt-SuggestBoxPopup .suggestPopupBottomRightInner {
}
```
### Class Constructors

<tr>
<td>10</td>
<td>boolean isAnimationEnabled()</td>
</tr>
<tr>
<td>11</td>
<td>protected void onEnsureDebugId(java.lang.String baseID)</td>
</tr>
<tr>
<td>12</td>
<td>void removeChangeListener(ChangeListener listener)</td>
</tr>
<tr>
<td>13</td>
<td>void removeClickListener(ClickListener listener)</td>
</tr>
<tr>
<td>14</td>
<td>void removeEventHandler(SuggestionHandler handler)</td>
</tr>
<tr>
<td>15</td>
<td>void removeFocusListener(FocusListener listener)</td>
</tr>
<tr>
<td>16</td>
<td>void removeKeyboardListener(KeyboardListener listener)</td>
</tr>
<tr>
<td>17</td>
<td>void setAccessKey(char key)</td>
</tr>
</tbody>
</table>
void setAnimationEnabled(boolean enable)
Enable or disable animations.

void setFocus(boolean focused)
Explicitly focus/unfocus this widget.

void setLimit(int limit)
Sets the limit to the number of suggestions the oracle should provide.

void setPopupStyleName(java.lang.String style)
Sets the style name of the suggestion popup.

void setTabIndex(int index)
Sets the widget's position in the tab index.

void setText(java.lang.String text)
Sets this object's text.

Methods Inherited
This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Composite
- java.lang.Object

SuggestionBox Widget Example
This example will take you through simple steps to show usage of a SuggestionBox Widget in GWT. Follow the following steps to update the GWT application we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>
</tr>
</tbody>
</table>
2 Modify HelloWorld.gwt.xml, HelloWorld.css, HelloWorld.html and HelloWorld.java as explained below. Keep rest of the files unchanged.

3 Compile and run the application to verify the result of the implemented logic.

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
<!-- Inherit the core Web Toolkit stuff. -->
<inherits name='com.google.gwt.user.User'/>

<!-- Inherit the default GWT style sheet. -->
<inherits name='com.google.gwt.user.theme.clean.Clean'/>

<!-- Specify the app entry point class. -->
<entry-point class='com.tutorialspoint.client.HelloWorld'/>

<!-- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
}
```
```html
    margin: 40px 0px 70px;
    text-align: center;
}

.gwt-SuggestBox {
    color: green;
}

.gwt-SuggestBoxPopup {
    border: thin 1px solid green;
    width: 200px;
}

.gwt-SuggestBoxPopup .item {
    color: red;
}

.gwt-SuggestBoxPopup .item-selected {
    color: gray;
}

.gwt-SuggestBoxPopup .suggestPopupTopLeft {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupTopLeftInner {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupTopCenter {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupTopCenterInner {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupTopRight {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupTopRightInner {
    border: thin 1px solid green;
}
```
GWT

```css
.gwt-SuggestBoxPopup .suggestPopupMiddleLeft {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupMiddleLeftInner {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupMiddleCenter {
    border: thin 1px solid green; width:200px;
}

.gwt-SuggestBoxPopup .suggestPopupMiddleCenterInner {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupMiddleRight {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupMiddleRightInner {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupBottomLeft {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupBottomLeftInner {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupBottomCenter {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupBottomCenterInner {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupBottomRight {
    border: thin 1px solid green;
}

.gwt-SuggestBoxPopup .suggestPopupBottomRightInner {
```
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript" src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>
<h1>SuggestionBox Widget Demonstration</h1>
<div id="gwtContainer"></div>
</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of SuggestionBox widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.MultiWordSuggestOracle;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.SuggestBox;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        //create the suggestion data
        MultiWordSuggestOracle oracle = new MultiWordSuggestOracle();
    }
}
```
oracle.add("A");
oracle.add("AB");
oracle.add("ABC");
oracle.add("ABCD");
oracle.add("B");
oracle.add("BC");
oracle.add("BCD");
oracle.add("BCDE");
oracle.add("C");
oracle.add("CD");
oracle.add("CDE");
oracle.add("CDEF");
oracle.add("D");
oracle.add("DE");
oracle.add("DEF");
oracle.add("DEFG");

//create the suggestion box and pass it the data created above
SuggestBox suggestionBox = new SuggestBox(oracle);

//set width to 200px.
suggestionBox.setWidth("200");

// Add suggestionbox to the root panel.
VerticalPanel panel = new VerticalPanel();
panel.add(suggestionBox);

RootPanel.get("gwtContainer").add(panel);
}
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:
GWT - TextBox Widget

Introduction
The TextBox widget represents a standard single-line text box.

Class Declaration
Following is the declaration for `com.google.gwt.user.client.ui.TextBox` class:

```java
public class TextBox
    extends TextBoxBase
    implements HasDirection
```
CSS Style Rules

Following default CSS Style rules will be applied to all the TextBox widget. You can override it as per your requirements.

```
.gwt-TextBox {}
.gwt-TextBox-readonly {}  
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>TextBox()</td>
</tr>
<tr>
<td></td>
<td>Creates an empty text box.</td>
</tr>
<tr>
<td>2</td>
<td>TextBox(Element element)</td>
</tr>
<tr>
<td></td>
<td>This constructor may be used by subclasses to explicitly use an existing element.</td>
</tr>
</tbody>
</table>

Class methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>HasDirection.Direction getDirection()</td>
</tr>
<tr>
<td></td>
<td>Gets the directionality of the widget.</td>
</tr>
<tr>
<td>2</td>
<td>int getMaxLength()</td>
</tr>
<tr>
<td></td>
<td>Gets the maximum allowable length of the text box.</td>
</tr>
<tr>
<td>3</td>
<td>int getVisibleLength()</td>
</tr>
<tr>
<td></td>
<td>Gets the number of visible characters in the text box.</td>
</tr>
<tr>
<td>4</td>
<td>void setDirection(HasDirection.Direction direction)</td>
</tr>
<tr>
<td></td>
<td>Sets the directionality for a widget.</td>
</tr>
<tr>
<td>5</td>
<td>void setMaxLength(int length)</td>
</tr>
<tr>
<td></td>
<td>Sets the maximum allowable length of the text box.</td>
</tr>
</tbody>
</table>

127
void setVisibleLength(int length)
Sets the number of visible characters in the text box.

static TextBox wrap(Element element)
Creates a TextBox widget that wraps an existing <input type='text'> element.

Methods Inherited
This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.FocusWidget
- com.google.gwt.user.client.ui.TextBoxBase
- java.lang.Object

TextBox Widget Example
This example will take you through simple steps to show usage of a TextBox Widget in GWT. Follow the following steps to update the GWT application we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>

<td>Modify HelloWorld.gwt.xml, HelloWorld.css, HelloWorld.html and HelloWorld.java as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
</module>
```
Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}

.gwt-TextBox {
    color: green;
}

.gwt-TextBox-readonly {
    background-color: yellow;
}
```

Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
```
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript" src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>
<h1>TextBox Widget Demonstration</h1>
<div id="gwtContainer"></div>
</body>
</html>

Let us have following content of Java file src/com.tutorialspoint/HelloWorld.java which will demonstrate use of TextBox widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TextBox;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        //create textboxes
        TextBox textBox1 = new TextBox();
        TextBox textBox2 = new TextBox();

        //add text to text box
        textBox2.setText("Hello World!");

        //set textbox as readonly
```
textBox2.setReadOnly(true);

// Add text boxes to the root panel.
VerticalPanel panel = new VerticalPanel();
panel.setSpacing(10);
panel.add(textBox1);
panel.add(textBox2);

RootPanel.get("gwtContainer").add(panel);

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

GWT - PasswordTextBox Widget

Introduction

The PasswordTextBox widget represents a standard single-line text box that visually masks its input to prevent eavesdropping.
**Class Declaration**

Following is the declaration for `com.google.gwt.user.client.ui.PasswordTextBox` class:

```java
public class PasswordTextBox
    extends TextBox
```

**CSS Style Rules**

Following default CSS Style rules will be applied to all the `PasswordTextBox` widget. You can override it as per your requirements.

```css
.gwt-PasswordTextBox {} 
.gwt-PasswordTextBox-readonly {} 
```

**Class Constructors**

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>PasswordTextBox()</code></td>
</tr>
<tr>
<td></td>
<td>Creates an empty password text box.</td>
</tr>
<tr>
<td>2</td>
<td><code>PasswordTextBox(Element element)</code></td>
</tr>
<tr>
<td></td>
<td>This constructor may be used by subclasses to explicitly use an existing element.</td>
</tr>
</tbody>
</table>

**Class Methods**

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>static PasswordTextBox wrap(Element element)</code></td>
</tr>
<tr>
<td></td>
<td>Creates a <code>PasswordTextBox</code> widget that wraps an existing <code>&lt;input type='password'&gt;</code> element.</td>
</tr>
</tbody>
</table>

**Methods Inherited**

This class inherits methods from the following classes:

- `com.google.gwt.user.client.ui.UIObject`
- `com.google.gwt.user.client.ui.Widget`
PasswordTextBox Widget Example

This example will take you through simple steps to show usage of a PasswordTextBox Widget in GWT. Follow the following steps to update the GWT application we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <code>HelloWorld</code> under a package <code>com.tutorialspoint</code> as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <code>HelloWorld.gwt.xml</code>, <code>HelloWorld.css</code>, <code>HelloWorld.html</code> and <code>HelloWorld.java</code> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
</module>
```
Following is the content of the modified Style Sheet file war/HelloWorld.css.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}

.gwt-PasswordTextBox {
    color: green;
}

.gwt-PasswordTextBox-readonly {
    background-color: yellow;
}
```

Following is the content of the modified HTML host file war/HelloWorld.html.

```html
<html>
<head>
<title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript"
        src="helloworld/helloworld.nocache.js">
    </script>
</head>
```

134
Let us have following content of Java file src/com.tutorialspoint/HelloWorld.java which will demonstrate use of PasswordTextBox widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.PasswordTextBox;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        //create password textboxes
        PasswordTextBox passwordTextBox1 = new PasswordTextBox();
        PasswordTextBox passwordTextBox2 = new PasswordTextBox();

        //add text to text box
        passwordTextBox2.setText("hell@world");

        //set textbox as readonly
        passwordTextBox2.setReadOnly(true);

        // Add text boxes to the root panel.
        VerticalPanel panel = new VerticalPanel();
        panel.setSpacing(10);
    }
}
```
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

---

**GWT - TextArea Widget**

**Introduction**

The **TextArea** widget represents a text box that allows multiple lines of text to be entered.

**Class Declaration**

Following is the declaration for `com.google.gwt.user.client.ui.TextArea` class:

```java
public class TextArea
```
extends TextBoxBase
    implements HasDirection

CSS Style Rules
Following default CSS Style rules will be applied to all the TextBox widget. You can override it as per your requirements.

```css
.gwt-TextArea {}
.gwt-TextArea-readonly {}
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>TextArea()</code></td>
</tr>
<tr>
<td></td>
<td>Creates an empty text area.</td>
</tr>
</tbody>
</table>

Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>int getCharacterWidth()</code></td>
</tr>
<tr>
<td></td>
<td>Gets the requested width of the text box (this is not an exact value, as not all characters are created equal).</td>
</tr>
<tr>
<td>2</td>
<td><code>int getCursorPos()</code></td>
</tr>
<tr>
<td></td>
<td>Gets the current position of the cursor (this also serves as the beginning of the text selection).</td>
</tr>
<tr>
<td>3</td>
<td><code>HasDirection.Direction getDirection()</code></td>
</tr>
<tr>
<td></td>
<td>Gets the directionality of the widget.</td>
</tr>
<tr>
<td>4</td>
<td><code>int getSelectionLength()</code></td>
</tr>
<tr>
<td></td>
<td>Gets the length of the current text selection.</td>
</tr>
<tr>
<td>5</td>
<td><code>int getVisibleLines()</code></td>
</tr>
</tbody>
</table>
Gets the number of text lines that are visible.

6 void setCharacterWidth(int width)
Sets the requested width of the text box (this is not an exact value, as not all characters are created equal).

7 void setDirection(HasDirection.Direction direction)
Sets the directionality for a widget.

8 void setVisibleLines(int lines)
Sets the number of text lines that are visible.

### Methods Inherited
This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.FocusWidget
- com.google.gwt.user.client.ui.TextBoxBase
- java.lang.Object

### Textbox Widget Example
This example will take you through simple steps to show usage of a TextBox Widget in GWT. Follow the following steps to update the GWT application we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <code>HelloWorld</code> under a package <code>com.tutorialspoint</code> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <code>HelloWorld.gwt.xml</code>, <code>HelloWorld.css</code>, <code>HelloWorld.html</code> and <code>HelloWorld.java</code> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>
Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
    <!-- Inherit the core Web Toolkit stuff. -->
    <inherits name='com.google.gwt.user.User'/>

    <!-- Inherit the default GWT style sheet. -->
    <inherits name='com.google.gwt.user.theme.clean.Clean'/>

    <!-- Specify the app entry point class. -->
    <entry-point class='com.tutorialspoint.client.HelloWorld'/>

    <!-- Specify the paths for translatable code -->
    <source path='client'/>
    <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}
.gwt-TextArea {
    color: green;
}
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
  <link rel="stylesheet" href="HelloWorld.css"/>
  <script language="javascript" src="helloworld/helloworld.nocache.js"></script>
</head>
<body>

<h1>TextArea Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of TextBox widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client EntryPoint;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TextArea;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        //create textarea elements
    }
}
```
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:
GWT - RichTextArea Widget

Introduction

The RichTextArea widget represents a rich text editor that allows complex styling and formatting. As some browsers do not support rich text editing, and others support only a limited subset of functionality, there are two formatter interfaces accessed via getBasicFormatter() and getExtendedFormatter().

A browser which does not support rich text editing at all will return null for both of these and one that supports only the basic functionality will return null for the latter getExtendedFormatter().

Class Declaration

Following is the declaration for com.google.gwt.user.client.ui.RichTextArea class:

```java
public class RichTextArea
    extends FocusWidget
    implements HasHTML, HasInitializeHandlers, HasSafeHtml
```
**CSS Style Rules**

Following default CSS Style rules will be applied to all the TextBox widget. You can override it as per your requirements.

```
.gwt-RichTextArea {}
```

</tr>
</tbody>
</table>

**Methods Inherited**

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.FocusWidget
- java.lang.Object

**RichTextbox Widget Example**

This example will take you through simple steps to show usage of a RichTextBox Widget in GWT. The following steps will help you update the GWT application which we created in *GWT - Create Application* chapter:
<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <em>com.tutorialspoint</em> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml</em>, <em>HelloWorld.css</em>, <em>HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor *src/com.tutorialspoint/HelloWorld.gwt.xml*.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file *war/HelloWorld.css*.

```css
body{
  text-align: center;
}
```
Following is the content of the modified HTML host file war/HelloWorld.html.

```html
<html>
<head>
<title>Hello World</title>
  <link rel="stylesheet" href="HelloWorld.css"/>
  <script language="javascript"
src="helloworld/helloworld.nocache.js">
  </script>
</head>
<body>

<h1>RichTextArea Widget Demonstration</h1>
</body>
</html>
```

Let us have following content of Java file src/com.tutorialspoint/HelloWorld.java which will demonstrate use of TextBox widget.
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.RichTextArea;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        //create RichTextArea elements
        RichTextArea richTextArea = new RichTextArea();

        richTextArea.setHeight("200");
        richTextArea.setWidth("200");

        //add text to text area
        richTextArea.setHTML("<b>Hello World!</b> <br/> <br/>
        "<i>Be Happy!</i> </br> <br/> <u>Stay Cool!</u>);

        // Add text boxes to the root panel.
        VerticalPanel panel = new VerticalPanel();
        panel.add(richTextArea);

        RootPanel.get("gwtContainer").add(panel);
    }
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce following result:
GWT - FileUpload Widget

Introduction

The FileUpload widget wraps the HTML `<input type='file'>` element. This widget must be used with FormPanel if it is to be submitted to a server.

Class Declaration

Following is the declaration for com.google.gwt.user.client.ui.FileUpload class:

```java
public class FileUpload
    extends Widget
    implements HasName, HasChangeHandlers
```

Css Style Rules

Following default CSS Style rules will be applied to all the TextBox widget. You can override it as per your requirements.
## Class Constructors

<table>
<thead>
<tr>
<th>S.No</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>FileUpload()</td>
</tr>
<tr>
<td></td>
<td>Constructs a new file upload widget.</td>
</tr>
<tr>
<td>2</td>
<td>FileUpload(Element element)</td>
</tr>
<tr>
<td></td>
<td>This constructor may be used by subclasses to explicitly use an existing element.</td>
</tr>
</tbody>
</table>

## Class Methods

<table>
<thead>
<tr>
<th>S.No</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>HandlerRegistration addChangeHandler(ChangeHandler handler)</td>
</tr>
<tr>
<td></td>
<td>Adds a ChangeEvent handler.</td>
</tr>
<tr>
<td>2</td>
<td>java.lang.String getFilename()</td>
</tr>
<tr>
<td></td>
<td>Gets the filename selected by the user.</td>
</tr>
<tr>
<td>3</td>
<td>java.lang.String getName()</td>
</tr>
<tr>
<td></td>
<td>Gets the widget's name.</td>
</tr>
<tr>
<td>4</td>
<td>boolean isEnabled()</td>
</tr>
<tr>
<td></td>
<td>Gets whether this widget is enabled.</td>
</tr>
<tr>
<td>5</td>
<td>void onBrowserEvent(Event event)</td>
</tr>
<tr>
<td></td>
<td>Fired whenever a browser event is received.</td>
</tr>
<tr>
<td>6</td>
<td>void setEnabled(boolean enabled)</td>
</tr>
<tr>
<td></td>
<td>Sets whether this widget is enabled.</td>
</tr>
<tr>
<td>7</td>
<td>void setName(java.lang.String name)</td>
</tr>
</tbody>
</table>
Sets the widget's name.

| 8 | static FileUpload wrap(Element element) |
|   | Creates a FileUpload widget that wraps an existing `<input type='file'>` element. |

**Methods Inherited**

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- java.lang.Object

**Fileupload Widget Example**

This example will take you through simple steps to show usage of a FileUpload Widget in GWT. The following steps will help you update the GWT application which is created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <code>HelloWorld</code> under a package <code>com.tutorialspoint</code> as explained in the <em>GWT - Create Application</em> chapter.</td>

<tr>
<td>2</td>
<td>Modify <code>HelloWorld.gwt.xml</code>, <code>HelloWorld.css</code>, <code>HelloWorld.html</code> and <code>HelloWorld.java</code> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>
  <!-- Inherit the default GWT style sheet. -->
</module>
```
<inherits name='com.google.gwt.user.theme.clean.Clean'/>

<!-- Specify the app entry point class. -->
<entry-point class='com.tutorialspoint.client.HelloWorld'/>

<!-- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>

</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}

.gwt-FileUpload {
    color: green;
}

Following is the content of the modified HTML host file war/HelloWorld.html.

<html>
<head>
<title>Hello World</title>

<link rel="stylesheet" href="HelloWorld.css"/>

<script language="javascript"
src="helloworld/helloworld.nocache.js">
</script>

</head>
<body>

</body>
</html>
Let us have following content of Java file
src/com.tutorialspoint/HelloWorld.java which will demonstrate use of
FileUpload widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.Button;
import com.google.gwt.user.client.ui.FileUpload;
import com.google.gwt.user.client.ui.FormPanel;
import com.google.gwt.user.client.ui.FormPanel.SubmitCompleteEvent;
import com.google.gwt.user.client.ui.Label;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        VerticalPanel panel = new VerticalPanel();
        //create a FormPanel
        final FormPanel form = new FormPanel();
        //create a file upload widget
        final FileUpload fileUpload = new FileUpload();
        //create labels
        Label selectLabel = new Label("Select a file:");
```

```java
```
//create upload button
Button uploadButton = new Button("Upload File");
//pass action to the form to point to service handling file
//receiving operation.
form.setAction("http://www.tutorialspoint.com/gwt/myFormHandler");
// set form to use the POST method, and multipart MIME encoding.
form.setEncoding(FormPanel.ENCODING_MULTIPART);
form.setMethod(FormPanel.METHOD_POST);

//add a label
panel.add(selectLabel);
//add fileUpload widget
panel.add(fileUpload);
//add a button to upload the file
panel.add(uploadButton);
uploadButton.addClickHandler(new ClickHandler() {
    @Override
    public void onClick(ClickEvent event) {
        //get the filename to be uploaded
        String filename = fileUpload.getFilename();
        if (filename.length() == 0) {
            Window.alert("No File Specified!");
        } else {
            //submit the form
            form.submit();
        }
    }
});

form.addSubmitCompleteHandler(new FormPanel.SubmitCompleteHandler() {
    @Override
    public void onSubmitComplete(SubmitCompleteEvent event) {
        // When the form submission is successfully completed, this
//event is fired. Assuming the service returned a response
//of type text/html, we can get the result text here
Window.alert(event.getResults());
}
});
panel.setSpacing(10);

// Add form to the root panel.
form.add(panel);

RootPanel.get("gwtContainer").add(form);
}
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in **GWT - Create Application** chapter. If everything is fine with your application, then this will produce the following result:
Following is the java server page code snippet demonstrating server side capability for file upload. We're using Common IO and Commons FileUpload libraries to add file-upload capability to server side page. File will be uploaded to uploadFiles folder relative to location where upload.jsp is located on server side.

```java
<%@ page import="org.apache.commons.fileupload.FileItemFactory"%>
<%@ page import="org.apache.commons.fileupload.disk.DiskFileItemFactory"%>
<%@ page import="org.apache.commons.fileupload.servlet.ServletFileUpload"%>
<%@ page import="org.apache.commons.fileupload.FileItem"%>
<%@ page import="org.apache.commons.io.FilenameUtils"%>
<%@ page import="java.util.List"%>
<%@ page import="java.util.Iterator"%>
<%@ page import="java.io.File"%>
<%@ page import="java.io.FileOutputStream"%>
```
<%@page import="java.io.InputStream"%>

// Create a factory for disk-based file items
FileItemFactory factory = new DiskFileItemFactory();
// Create a new file upload handler
ServletFileUpload upload = new ServletFileUpload(factory);
try{
    // Parse the request
    List items = upload.parseRequest(request);

    // Process the uploaded items
    Iterator iter = items.iterator();

    while (iter.hasNext()) {
        FileItem item = (FileItem) iter.next();
        // handling a normal form-field
        if(item.isFormField()) {
            System.out.println("Got a form field");
            String name = item.getFieldName();
            String value = item.getString();
            System.out.print("Name:")+name+",Value:"+value);
        } else { // handling file loads
            System.out.println("Not form field");
            String fieldName = item.getFieldName();
            String fileName = item.getName();
            if (fileName != null) {
                fileName = FilenameUtils.getName(fileName);
            }
            String contentType = item.getContentType();
            boolean isInMemory = item.isInMemory();
            long sizeInBytes = item.getSize();
            System.out.print("Field Name:")+fieldName
GWT

```java
+",File Name:"+fileName);
System.out.print("Content Type:"+contentType
+",Is In Memory:"+isInMemory","Size:"+sizeInBytes);

byte[] data = item.get();
fileName = getServletContext()
    .getRealPath( "/uploadedFiles/" + fileName);
System.out.print("File name:" +fileName);
FileOutputStream fileOutSt = new
FileOutputStream(fileName);
fileOutSt.write(data);
fileOutSt.close();
out.print("File Uploaded Successfully!");
}
} catch(Exception e){
    out.print("File Uploading Failed!" + e.getMessage());
}
%>

GWT - Hidden Widget

Introduction
The **Hidden** widget represents a hidden field in an HTML form.

Class Declaration
Following is the declaration for `com.google.gwt.user.client.ui.Hidden` class:

```java
public class Hidden
    extends Widget
    implements HasName
```
### Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Hidden()</td>
</tr>
<tr>
<td></td>
<td>Constructor for Hidden.</td>
</tr>
<tr>
<td>2</td>
<td>Hidden(Element element)</td>
</tr>
<tr>
<td></td>
<td>This constructor may be used by subclasses to explicitly use an existing element.</td>
</tr>
<tr>
<td>3</td>
<td>Hidden(java.lang.String name)</td>
</tr>
<tr>
<td></td>
<td>Constructor for Hidden.</td>
</tr>
<tr>
<td>4</td>
<td>Hidden(java.lang.String name, java.lang.String value)</td>
</tr>
<tr>
<td></td>
<td>Constructor for Hidden.</td>
</tr>
</tbody>
</table>

### Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>java.lang.String getDefaultValue()</td>
</tr>
<tr>
<td></td>
<td>Gets the default value of the hidden field.</td>
</tr>
<tr>
<td>2</td>
<td>java.lang.String getID()</td>
</tr>
<tr>
<td></td>
<td>Gets the id of the hidden field.</td>
</tr>
<tr>
<td>3</td>
<td>java.lang.String getName()</td>
</tr>
<tr>
<td></td>
<td>Gets the name of the hidden field.</td>
</tr>
<tr>
<td>4</td>
<td>java.lang.String getValue()</td>
</tr>
<tr>
<td></td>
<td>Gets the value of the hidden field.</td>
</tr>
<tr>
<td>5</td>
<td>void setDefaultValue(java.lang.String defaultValue)</td>
</tr>
<tr>
<td></td>
<td>Sets the default value of the hidden field.</td>
</tr>
</tbody>
</table>
void setID(java.lang.String id)
Sets the id of the hidden field.

void setName(java.lang.String name)
Sets the name of the hidden field.

void setValue(java.lang.String value)
Sets the value of the hidden field.

static Hidden wrap(Element element)
Creates a Hidden widget that wraps an existing <input type='hidden'> element.

Methods Inherited
This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- java.lang.Object

Hidden Widget Example
This example will take you through simple steps to show usage of a Hidden Widget in GWT. Follow the following steps to update the GWT application which we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>
Following is the content of the modified module descriptor **src/com.tutorialspoint/HelloWorld.gwt.xml**.

```
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file **war/HelloWorld.css**.

```
body{
  text-align: center;
  font-family: verdana, sans-serif;
}

h1{
  font-size: 2em;
  font-weight: bold;
  color: #777777;
  margin: 40px 0px 70px;
  text-align: center;
}
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript" src="helloworld/helloworld.nocache.js"></script>
</head>
<body>
<h1>Hidden Widget Demonstration</h1>
<div id="gwtContainer"></div>
</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of Hidden widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.Button;
import com.google.gwt.user.client.ui.Hidden;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TextBox;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
```
//create textboxes
final TextBox textBox = new TextBox();
textBox.setWidth("275");
Button button1 = new Button("Set Value of Hidden Input");
Button button2 = new Button("Get Value of Hidden Input");
final Hidden hidden = new Hidden();

button1.addClickHandler(new ClickHandler() {
    @Override
    public void onClick(ClickEvent event) {
        hidden.setValue(textBox.getValue());
        Window.alert("Value of Hidden Widget Updated!");
    }
});

button2.addClickHandler(new ClickHandler() {
    @Override
    public void onClick(ClickEvent event) {
        Window.alert("Value of Hidden Widget: "+
        hidden.getValue());
    }
});

// Add widgets to the root panel.
VerticalPanel panel = new VerticalPanel();
panel.setSpacing(10);
panel.add(textBox);
panel.add(button1);
panel.add(hidden);
panel.add(button2);

RootPanel.get("gwtContainer").add(panel);
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, this will produce following result:

![Screenhots of GWT application demonstrating hidden widget functionality]
“Complex widgets” allow users to perform advanced interaction capability with the application. Every complex widget inherits properties from Widget class which in turn inherits properties from UIObject.

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Widget &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GWT UIObject Class</td>
</tr>
<tr>
<td></td>
<td>This widget contains text, not interpreted as HTML using a &lt;div&gt; element, causing it to be displayed with block layout.</td>
</tr>
<tr>
<td>2</td>
<td>GWT Widget Class</td>
</tr>
<tr>
<td></td>
<td>This widget can contain HTML text and displays the html content using a &lt;div&gt; element, causing it to be displayed with block layout.</td>
</tr>
</tbody>
</table>

**GWT - UIObject Class**

**Introduction**

The class **UIObject** is the superclass for all user-interface objects. It simply wraps a DOM element, and cannot receive events. It provides direct child classes like Widget, MenuItem, MenuItemSeparator, TreeItem.

- All UIObject objects can be styled using CSS.
- Every UIObject has a primary style name that identifies the key CSS style rule that should always be applied to it.
- More complex styling behavior can be achieved by manipulating an object's secondary style names.

**Class Declaration**

Following is the declaration for **com.google.gwt.user.client.ui.UIObject** class:

```java
public abstract class UIObject
    extends java.lang.Object
```
Field
Following are the fields for com.google.gwt.user.client.ui.UIObject class:

- public static final java.lang.String DEBUG_ID_PREFIX -- The element ID that you specify will be prefixed by the static string DEBUG_ID_PREFIX.

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>

</tr>
<tr>
<td>28</td>
<td>protected static void setStyleName(Element elem, java.lang.String style, boolean add)</td>
</tr>
</tbody>
</table>
This convenience method adds or removes a style name for a given element.

29  void setStyleName(java.lang.String style)
    Clears all of the object's style names and sets it to the given style.

30  protected static void setStylePrimaryName(Element elem,
                                            java.lang.String style)
    Sets the element's primary style name and updates all dependent style names.

31  void setStylePrimaryName(java.lang.String style)
    Sets the object's primary style name and updates all dependent style names.

32  void setTitle(java.lang.String title)
    Sets the title associated with this object.

33  void setVisible(boolean visible)
    Sets whether this object is visible.

34  static void setVisible(Element elem, boolean visible)
    Sets whether this element is visible

35  void setWidth(java.lang.String width)
    Sets the object's width.

36  java.lang.String toString()
    This method is overridden so that any object can be viewed in the debugger as an HTML snippet.

37  void unsinkEvents(int eventBitsToRemove)
    Removes a set of events from this object's event list.

**Methods inherited**

This class inherits methods from the following classes:
GWT - Widget Class

Introduction
The class Widget is the base class for the majority of user-interface objects. Widget adds support for receiving events from the browser and being added directly to panels.

Class Declaration
Following is the declaration for com.google.gwt.user.client.ui.Widget class:

```java
public class Widget
    extends UIObject
    implements EventListener
```

Field
Following are the fields for com.google.gwt.user.client.ui.Widget class:

- `public static final java.lang.String DEBUG_ID_PREFIX` -- The element ID that you specify will be prefixed by the static string DEBUG_ID_PREFIX.

Class Constructors

<table>

</tr>
<tr>
<td>11</td>
<td><code>protected void onAttach()</code></td>
</tr>
<tr>
<td>12</td>
<td><code>void onBrowserEvent(Event event)</code></td>
</tr>
</tbody>
</table>
Fired whenever a browser event is received.

protected void onDetach()
This method is called when a widget is detached from the browser's document.

protected void onLoad()
Gets a handle to the object's underlying DOM element.

protected void onUnload()
This method is called immediately before a widget will be detached from the browser's document.

void removeFromParent()
Removes this widget from its parent widget.

void sinkEvents(int eventBitsToAdd)
Overridden to defer the call to super.sinkEvents until the first time this widget is attached to the dom, as a performance enhancement.

**Methods inherited**

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject

**Complex Widgets**

Following are few important Complex Widgets:

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Widget &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Tree</td>
</tr>
<tr>
<td></td>
<td>This widget represents a standard hierarchical tree widget. The tree contains a hierarchy of TreeItems that the user can open, close, and select.</td>

</tr>
</tbody>
</table>
Command or open a cascaded menu bar.

3  DatePicker
   This widget represents a standard GWT date picker.

4  CellTree
   This widget represents a view of a tree. This widget will only work in standards mode, which requires that the HTML page in which it is run have an explicit <!DOCTYPE> declaration.

5  CellList
   This widget represents a single column list of cells.

6  CellTable
   This widget represents a tabular view that supports paging and columns.

7  CellBrowser
   This widget represents a browsable view of a tree in which only a single node per level may be open at one time. This widget will only work in standards mode, which requires that the HTML page in which it is run have an explicit <!DOCTYPE> declaration.

---

**GWT - Tree Widget**

**Introduction**

The Tree widget represents a standard hierarchical tree widget. The tree contains a hierarchy of TreeItems that the user can open, close, and select.

**Class Declaration**

Following is the declaration for com.google.gwt.user.client.ui.Tree class:

```java
public class Tree
    extends Widget
```
implements HasWidgets, SourcesTreeEvents, HasFocus, 
HasAnimation, HasAllKeyHandlers, HasAllFocusHandlers, 
HasSelectionHandlers, HasOpenHandlers, 
HasCloseHandlers, SourcesMouseEvents, 
HasAllMouseHandlers

**CSS Style Rules**

Following default CSS Style rules will be applied to all the Tree widget. You can override it as per your requirements.

```css
.gwt-Tree {}
.gwt-TreeItem {}
.gwt-TreeItem-selected {}
```

**Class Constructors**

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Tree()</td>
</tr>
<tr>
<td></td>
<td>Constructs an empty tree.</td>

<td>void setSelectedItem(TreeItem item, boolean fireEvents)</td>
</tr>
<tr>
<td>36</td>
<td>void setTabIndex(int index)</td>
</tr>
</tbody>
</table>
java.util.Iterator<TreeItem> treeItemIterator()
Iterator of tree items.

Methods Inherited
This class inherits methods from the following classes:
- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- java.lang.Object

Tree Widget Example
This example will take you through simple steps to show usage of a Tree Widget in GWT. Follow the following steps to update the GWT application we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify HelloWorld.gwt.xml, HelloWorld.css, HelloWorld.html and HelloWorld.java as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>
</module>
```
<!-- Specify the app entry point class.-->
<entry-point class='com.tutorialspoint.client.HelloWorld'/>

<!-- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>
</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}

.gwt-Label {
    font-weight: bold;
    color: maroon;
}

.gwt-Tree .gwt-TreeItem {
    padding: 1px 0px;
    margin: 0px;
    white-space: nowrap;
    cursor: hand;
    cursor: pointer;
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css" />
<script language="javascript" src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>
<h1>Tree Widget Demonstration</h1>
<div id="gwtContainer"></div>
</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of Tree widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.logical.shared.SelectionEvent;
import com.google.gwt.event.logical.shared.SelectionHandler;
import com.google.gwt.user.client.ui.Label;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.Tree;
```
import com.google.gwt.user.client.ui.TreeItem;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        //create a label
        final Label labelMessage = new Label();
        labelMessage.setWidth("300");

        // Create a root tree item as department
        TreeItem department = new TreeItem("Department");

        //create other tree items as department names
        TreeItem salesDepartment = new TreeItem("Sales");
        TreeItem marketingDepartment = new TreeItem("Marketing");
        TreeItem manufacturingDepartment = new TreeItem("Manufacturing");

        //create other tree items as employees
        TreeItem employee1 = new TreeItem("Robert");
        TreeItem employee2 = new TreeItem("Joe");
        TreeItem employee3 = new TreeItem("Chris");

        //add employees to sales department
        salesDepartment.addItem(employee1);
        salesDepartment.addItem(employee2);
        salesDepartment.addItem(employee3);

        //create other tree items as employees
        TreeItem employee4 = new TreeItem("Mona");
        TreeItem employee5 = new TreeItem("Tena");

        //add employees to marketing department
        marketingDepartment.addItem(employee4);
        marketingDepartment.addItem(employee5);
// create other tree items as employees
TreeItem employee6 = new TreeItem("Rener");
TreeItem employee7 = new TreeItem("Linda");

// add employees to sales department
manufacturingDepartment.addItem(employee6);
manufacturingDepartment.addItem(employee7);

// add departments to department item
department.addItem(salesDepartment);
department.addItem(marketingDepartment);
department.addItem(manufacturingDepartment);

// create the tree
Tree tree = new Tree();

// add root item to the tree
tree.addItem(department);

tree.addSelectionHandler(new SelectionHandlerL<TreeItem>() {
    @Override
    public void onSelection(SelectionEvent<TreeItem> event) {
        labelMessage.setText("Selected Value: " + event.getSelectedItem().getText());
    }
});

// Add text boxes to the root panel.
VerticalPanel panel = new VerticalPanel();
panel.setSpacing(10);
panel.add(tree);
panel.add(labelMessage);
//add the tree to the root panel
RootPanel.get("gwtContainer").add(panel);
}
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, this will produce the following result:

Selecting any value in tree, will update a message below the tree displaying the selected value.
GWT - MenuBar Widget

Introduction
The MenuBar widget represents a standard menu bar widget. A menu bar can contain any number of menu items, each of which can either fire a Command or open a cascaded menu bar.

Class Declaration
Following is the declaration for com.google.gwt.user.client.ui.MenuBar class:

```java
public class MenuBar
    extends Widget
    implements PopupListener, HasAnimation,
               HasCloseHandlers<PopupPanel>
```

CSS Style Rules
Following default CSS Style rules will be applied to all the MenuBar widget. You can override it as per your requirements.

```css
.gwt-MenuBar {}
gwt-MenuBar-horizontal {}
gwt-MenuBar-vertical{}
gwt-MenuBar .gwt-MenuItem {}
gwt-MenuBar .gwt-MenuItem-selected {}
gwt-MenuBar .gwt-MenuItemSeparator {}
gwt-MenuBar .gwt-MenuItemSeparator .menuSeparatorInner {}
gwt-MenuBarPopup .menuPopupTopLeft {}
gwt-MenuBarPopup .menuPopupTopLeftInner {}
gwt-MenuBarPopup .menuPopupTopCenter {}
gwt-MenuBarPopup .menuPopupTopCenterInner {}
gwt-MenuBarPopup .menuPopupTopRight {}
gwt-MenuBarPopup .menuPopupTopRightInner {}
gwt-MenuBarPopup .menuPopupMiddleLeft {}
gwt-MenuBarPopup .menuPopupMiddleLeftInner {}
gwt-MenuBarPopup .menuPopupMiddleCenter {}
gwt-MenuBarPopup .menuPopupMiddleCenterInner {}
```
Class Constructors

### Method Details

<table>
<thead>
<tr>
<th>Line</th>
<th>Method Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>21</td>
<td><code>MenuItemSeparator insertSeparator(MenuItemSeparator separator, int beforeIndex)</code></td>
<td>Adds a thin line to the MenuBar to separate sections of MenuItems at the specified index.</td>
</tr>
<tr>
<td>22</td>
<td><code>boolean isAnimationEnabled()</code></td>
<td>Returns true if animations are enabled, false if not.</td>
</tr>
<tr>
<td>23</td>
<td><code>boolean isFocusOnHoverEnabled()</code></td>
<td>Check whether or not this widget will steal keyboard focus when the mouse hovers over it.</td>
</tr>
<tr>
<td>24</td>
<td><code>void moveSelectionDown()</code></td>
<td>Moves the menu selection down to the next item.</td>
</tr>
<tr>
<td>25</td>
<td><code>void moveSelectionUp()</code></td>
<td>Moves the menu selection up to the previous item.</td>
</tr>
<tr>
<td>26</td>
<td><code>void onBrowserEvent(Event event)</code></td>
<td>Fired whenever a browser event is received.</td>
</tr>
<tr>
<td>27</td>
<td><code>protected void onDetach()</code></td>
<td>This method is called when a widget is detached from the browser's document.</td>
</tr>
<tr>
<td>28</td>
<td><code>protected void onEnsureDebugId(java.lang.String baseID)</code></td>
<td>Affected Elements: -item# = the MenuItem at the specified index.</td>
</tr>
<tr>
<td>29</td>
<td><code>void onPopupClosed(PopupPanel sender, boolean autoClosed)</code></td>
<td>Deprecated. Use <code>addCloseHandler(CloseHandler)</code> instead</td>
</tr>
<tr>
<td>30</td>
<td><code>void removeItem(MenuItem item)</code></td>
<td>Removes the specified menu item from the bar.</td>
</tr>
<tr>
<td>31</td>
<td><code>void removeSeparator(MenuItemSeparator separator)</code></td>
<td>Removes the specified MenuItemSeparator from the bar.</td>
</tr>
</tbody>
</table>
void selectItem(MenuItem item)
Select the given MenuItem, which must be a direct child of this MenuBar.

void setAnimationEnabled(boolean enable)
Enable or disable animations.

void setAutoOpen(boolean autoOpen)
Sets whether this menu bar's child menus will open when the mouse is moved over it.

void setFocusOnHoverEnabled(boolean enabled)
Enable or disable auto focus when the mouse hovers over the MenuBar.

**Methods Inherited**
This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- java.lang.Object

**MenuBar Widget Example**
This example will take you through simple steps to show usage of a MenuBar Widget in GWT. Follow the following steps to update the GWT application we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>

html>body .gwt-MenuBarPopup {
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
  <link rel="stylesheet" href="HelloWorld.css"/>
  <script language="javascript" src="helloworld/helloworld.nocache.js">
  </script>
</head>
<body>
</body>
```
Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of MenuBar widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.Command;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.MenuBar;
import com.google.gwt.user.client.ui.MenuItem;
import com.google.gwt.user.client.ui.RootPanel;

public class HelloWorld implements EntryPoint {

    private void showSelectedMenuItem(String menuItemName){
        Window.alert("Menu item: "+menuItemName+" selected");
    }

    public void onModuleLoad() {

        // Create a menu bar
        MenuBar menu = new MenuBar();
        menu.setAutoOpen(true);
        menu.setWidth("100px");
        menu.setAnimationEnabled(true);
    }
}
```
// Create the file menu
MenuBar fileMenu = new MenuBar(true);
fileMenu.setAnimationEnabled(true);

fileMenu.addItem("New", new Command() {
    @Override
    public void execute() {
        showSelectedMenuItem("New");
    }
});
fileMenu.addItem("Open", new Command() {
    @Override
    public void execute() {
        showSelectedMenuItem("Open");
    }
});
fileMenu.addSeparator();
fileMenu.addItem("Exit", new Command() {
    @Override
    public void execute() {
        showSelectedMenuItem("Exit");
    }
});

// Create the edit menu
MenuBar editMenu = new MenuBar(true);
editMenu.setAnimationEnabled(true);

editMenu.addItem("Undo", new Command() {
    @Override
    public void execute() {
        showSelectedMenuItem("Undo");
    }
});
editMenu.addItem("Redo", new Command() {
    @Override
    public void execute() {
        showSelectedMenuItem("Redo");
    }
});
editMenu.addItem("Cut", new Command() {
    @Override
    public void execute() {
        showSelectedMenuItem("Cut");
    }
});
editMenu.addItem("Copy", new Command() {
    @Override
    public void execute() {
        showSelectedMenuItem("Copy");
    }
});
editMenu.addItem("Paste", new Command() {
    @Override
    public void execute() {
        showSelectedMenuItem("Paste");
    }
});

menu.addItem(new MenuItem("File", fileMenu));
menu.addSeparator();
menu.addItem(new MenuItem("Edit", editMenu));

//add the menu to the root panel
RootPanel.get("gwtContainer").add(menu);
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

Selecting any value in menubar, will popup an alert message showing the selected value.
GWT - DatePicker Widget

Introduction

The DatePicker widget represents a standard GWT date picker.

Class Declaration

Following is the declaration for com.google.gwt.user.datepicker.client.DatePicker class:

```
public class DatePicker
    extends Composite
    implements HasHighlightHandlers<java.util.Date>,
              HasShowRangeHandlers<java.util.Date>,
    HasValue<java.util.Date>
```

CSS Style Rules

Following default CSS Style rules will be applied to all the DatePicker widget. You can override it as per your requirements.

```
.gwt-DatePicker { }
.datePickerMonthSelector { }
.datePickerMonth { }
.datePickerPreviousButton { }
.datePickerNextButton { }
.datePickerDays { }
.datePickerWeekdayLabel { }
.datePickerWeekendLabel { }
.datePickerDay { }
.datePickerDayIsToday { }
.datePickerDayIsWeekend { }
.datePickerDayIsFiller { }
.datePickerDayIsValue { }
.datePickerDayIsDisabled { }
.datePickerDayIsHighlighted { }
.datePickerDayIsValueAndHighlighted { }
```
# Class Constructors

<td>Handler Registration</td>
</tr>
<tr>
<td></td>
<td>addShow Range Handler AndFire (Show Range Handler&lt;java.util.Date&gt; handler)</td>
</tr>
<tr>
<td></td>
<td>Adds a show range handler and immediately activate the handler on the current view.</td>
</tr>
<tr>
<td>4</td>
<td>void addStyleToDates(java.lang.String styleName, java.util.Date date)</td>
</tr>
<tr>
<td></td>
<td>Add a style name to the given dates.</td>
</tr>
<tr>
<td>5</td>
<td>void addStyleToDates(java.lang.String styleName, java.util.Date date, java.util.Date... moreDates)</td>
</tr>
<tr>
<td></td>
<td>Add a style name to the given dates.</td>
</tr>
<tr>
<td>6</td>
<td>void add Style To Dates(java.lang.String style Name, java.lang.Iterable&lt;java.util.Date&gt; dates)</td>
</tr>
</tbody>
</table>
Add a style name to the given dates.

```java
void addTransientStyleToDates(java.lang.String styleName,
                              java.util.Date date)
```

Adds the given style name to the specified dates, which must be visible.

```java
void addTransientStyleToDates(java.lang.String styleName,
                              java.util.Date date,
                              java.util.Date... moreDates)
```

Adds the given style name to the specified dates, which must be visible.

```java
void addTransientStyleToDates(java.lang.String styleName,
                              java.lang.Iterable<java.util.Date> dates)
```

Adds the given style name to the specified dates, which must be visible.

```java
HandlerRegistration addValueChangeHandler(ValueChangeHandler<java.util.Date> handler)
```

Adds a ValueChangeEvent handler.

```java
java.util.Date getCurrentMonth()
```

Gets the current month the date picker is showing.

```java
java.util.Date getFirstDate()
```

Returns the first shown date.

```java
java.util.Date getHighlightedDate()
```

Gets the highlighted date (the one the mouse is hovering over), if any.

```java
java.util.Date getLastDate()
```

Returns the last shown date.

```java
protected CalendarModel getModel()
```

Gets the CalendarModel associated with this date picker.

```java
protected MonthSelector getMonthSelector()
```
<table>
<thead>
<tr>

</tr>
<tr>
<td>34</td>
<td>void setValue(java.util.Date newValue, boolean fireEvents)</td>
<td>Sets the DatePicker's value.</td>
</tr>
</tbody>
</table>

**Methods Inherited**

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Composite
- java.lang.Object
Datepicker Widget Example

This example will take you through simple steps to show usage of a DatePicker Widget in GWT. Follow the following steps to update the GWT application we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <em>com.tutorialspoint</em> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml</em>, <em>HelloWorld.css</em>, <em>HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor *src/com.tutorialspoint/HelloWorld.gwt.xml*.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```
Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}

.gwt-DatePicker {

    cursor: hand;
    cursor: pointer;
    font-weight: bold;
    padding: 0px 4px;
    outline: none;
}
td.datePickerMonth {
    text-align: center;
    vertical-align: middle;
    white-space: nowrap;
Following is the content of the modified HTML host file **war/HelloWorld.html**.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript"
src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>

<h1>DatePicker Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```
Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of Tree widget.

```java
package com.tutorialspoint.client;

import java.util.Date;

import com.google.gwt.core.client EntryPoint;
import com.google.gwt.event.logical.shared.ValueChangeEvent;
import com.google.gwt.event.logical.shared.ValueChangeHandler;
import com.google.gwt.i18n.client.DateTimeFormat;
import com.google.gwt.user.client.ui.Label;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;
import com.google.gwt.user.datepicker.client.DateBox;
import com.google.gwt.user.datepicker.client.DatePicker;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        // Create a basic date picker
        DatePicker datePicker = new DatePicker();
        final Label text = new Label();

        // Set the value in the text box when the user selects a date
        datePicker.addValueChangeHandler(new ValueChangeHandler<Date>() {
            @Override
            public void onValueChange(ValueChangeEvent<Date> event) {
                Date date = event.getValue();
                String dateString = DateTimeFormat.getFormat("MM/dd/yyyy").format(date);
                text.setText(dateString);
            }
        });
    }
}
```
// Set the default value

datePicker.setValue(new Date(), true);

// Create a DateBox

DateTimeFormat dateFormat =
DateTimeFormat.getFormat("MM/dd/yyyy");

DateBox dateBox = new DateBox();

dateBox.setFormat(new DateBox.DefaultFormat(dateFormat));

Label selectLabel = new Label("Permanent DatePicker:");
Label selectLabel2 = new Label("DateBox with popup DatePicker:");

// Add widgets to the root panel.
verticalPanel vPanel = new VerticalPanel();

vPanel.setSpacing(10);

vPanel.add(selectLabel);

vPanel.add(text);

vPanel.add(datePicker);

vPanel.add(selectLabel2);

vPanel.add(dateBox);

RootPanel.get("gwtContainer").add(vPanel);

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then will produce the following result:
GWT - CellTree Widget

Introduction
The CellTree widget represents a view of a tree.
Class Declaration
Following is the declaration for com.google.gwt.user.cellview.client.CellTree class:

```
public class CellTree
    extends AbstractCellTree
    implements HasAnimation, Focusable
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
</table>
| 1    | CellTree(TreeViewModel viewModel, T rootValue)  
      | Construct a new CellTree. |
| 2    | CellTree(TreeViewModel viewModel, T rootValue, CellTree.Resources resources)  
      | Construct a new CellTree. |

Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
</table>
| 1    | protected char getAccessKey()  
      | Get the access key. |
| 2    | CellTree.NodeAnimation getAnimation()  
      | Get the animation used to open and close nodes in this tree if animations are enabled. |
| 3    | int getDefaultNodeSize()  
      | Get the default maximum number of children to display under each tree node. |
| 4    | TreeNode getRootTreeNode()  
      | Get the root TreeNode. |
5  int getTabIndex()
   Gets the widget's position in the tab index.

6  boolean isAnimationEnabled()
   Returns true if animations are enabled, false if not.

7  protected void onBlur()
   Called when the keyboard selected node loses focus.

8  void onBrowserEvent(Event event)
   Fired whenever a browser event is received.

9  protected void onFocus()
   Called when the keyboard selected node gains focus.

10 void setAccessKey(char key)
    Sets the widget's 'access key'.

11 void setAnimation(CellTree.NodeAnimation animation)
    Set the animation used to open and close nodes in this tree.

12 void setAnimationEnabled(boolean enable)
    Enable or disable animations.

13 void setDefaultNodeSize(int defaultNodeSize)
    Set the default number of children to display beneath each child node.

14 void setFocus(boolean focused)
    Explicitly focus/unfocus this widget.

15 void setTabIndex(int index)
    Sets the widget's position in the tab index.

Methods Inherited
This class inherits methods from the following classes:

    </script>
</head>
<body>

<h1>CellTree Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```
Let us have following content of Java file src/com.tutorialspoint/HelloWorld.java which will demonstrate use of CellTree widget.

```java
package com.tutorialspoint.client;

import java.util.ArrayList;
import java.util.List;

import com.google.gwt.cell.client.AbstractCell;
import com.google.gwt.cell.client.Cell;
import com.google.gwt.cell.client.TextCell;
import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.core.client.GWT;
import com.google.gwt.safehtml.shared.SafeHtmlBuilder;
import com.google.gwt.user.cellview.client.CellTree;
import com.google.gwt.user.cellview.client.HasKeyboardSelectionPolicy.
HasKeyboardSelectionPolicy;
import com.google.gwt.user.cellview.client TreeNode;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;
import com.google.gwt.view.client.ListDataProvider;
import com.google.gwt.view.client.SingleSelectionModel;
import com.google.gwt.view.client.TreeViewModel;

public class HelloWorld implements EntryPoint {

    /**
     * A list of songs.
     */
    private static class Playlist {
        private final String name;
        private final List<String> songs = new ArrayList<String>();
    }
```
public Playlist(String name) {
    this.name = name;
}

/**
 * Add a song to the playlist.
 * @param name the name of the song
 */
public void addSong(String name) {
    songs.add(name);
}

public String getName() {
    return name;
}

/**
 * Return the list of songs in the playlist.
 */
public List<String> getSongs() {
    return songs;
}

/**
 * A composer of classical music.
 */
private static class Composer {
    private final String name;
    private final List<Playlist> playlists = new ArrayList<Playlist>();

    public Composer(String name) {

this.name = name;
}

/**
 * Add a playlist to the composer.
 * @param playlist the playlist to add
 */
public Playlist addPlaylist(Playlist playlist) {
    playlists.add(playlist);
    return playlist;
}

public String getName() {
    return name;
}

/**
 * Return the rockin' playlist for this composer.
 */
public List<Playlist> getPlaylists() {
    return playlists;
}

/**
 * The model that defines the nodes in the tree.
 */
private static class CustomTreeModel implements TreeViewModel {

    private final List<Composer> composers;

    /**
     * This selection model is shared across all leaf nodes.
     */
A selection model can also be shared across all nodes in the tree, or each set of child nodes can have its own instance. This gives you flexibility to determine how nodes are selected.

```java
private final SingleSelectionModel<String> selectionModel = new SingleSelectionModel<String>();

public CustomTreeModel() {
    // Create a database of information.
    composers = new ArrayList<Composer>();

    // Add compositions by Beethoven.
    Composer beethoven = new Composer("Beethoven");
    composers.add(beethoven);

    Playlist concertos = beethoven.addPlaylist(new Playlist("Concertos"));
    concertos.addSong("No. 1 - C");
    concertos.addSong("No. 2 - B-Flat Major");
    concertos.addSong("No. 3 - C Minor");
    concertos.addSong("No. 4 - G Major");
    concertos.addSong("No. 5 - E-Flat Major");

    Playlist quartets = beethoven.addPlaylist(new Playlist("Quartets"));
    quartets.addSong("Six String Quartets");
    quartets.addSong("Three String Quartets");
    quartets.addSong("Grosse Fugue for String Quartets");

    Playlist sonatas = beethoven.addPlaylist(new Playlist("Sonatas"));
    sonatas.addSong("Sonata in A Minor");
```
GWT

sonatas.addSong("Sonata in F Major");

Playlist symphonies = beethoven.addPlaylist(
    new Playlist("Symphonies"));
symphonies.addSong("No. 2 - D Major");
symphonies.addSong("No. 2 - D Major");
symphonies.addSong("No. 3 - E-Flat Major");
symphonies.addSong("No. 4 - B-Flat Major");
symphonies.addSong("No. 5 - C Minor");
symphonies.addSong("No. 6 - F Major");
symphonies.addSong("No. 7 - A Major");
symphonies.addSong("No. 8 - F Major");
symphonies.addSong("No. 9 - D Minor");
}

// Add compositions by Brahms.
{
    Composer brahms = new Composer("Brahms");
    composers.add(brahms);
    Playlist concertos = brahms.addPlaylist(
        new Playlist("Concertos"));
    concertos.addSong("Violin Concerto");
    concertos.addSong("Double Concerto - A Minor");
    concertos.addSong("Piano Concerto No. 1 - D Minor");
    concertos.addSong("Piano Concerto No. 2 - B-Flat Major");

    // The leaf nodes are the songs, which are Strings.
    if (value instanceof String) {
        return true;
    }
    return false;
}
} } 

public void onModuleLoad() {
    // Create a model for the tree.
    TreeViewModel model = new CustomTreeModel();
    // Get CellTree style using its BasicResources
    // CellTree.Resources res = GWT.create(CellTree.BasicResources.class);
    /*
    * Create the tree using the model. We use <code>null</code> as the default value of the root node. The default value will
    * be passed to CustomTreeModel#getNodeInfo();
    */
    CellTree tree = new CellTree(model, null);

    tree.setKeyboardSelectionPolicy(KeyboardSelectionPolicy.ENABLED);
    // Open the first playlist by default.
    TreeNode rootNode = tree.getRootTreeNode();
    TreeNode firstPlaylist = rootNode.setChildOpen(0, true);
    firstPlaylist.setChildOpen(0, true);

    VerticalPanel panel = new VerticalPanel();
    panel.setBorderWidth(1);
    panel.setWidth("300");
    panel.add(tree);
    // Add the widgets to the root panel.
    RootPanel.get().add(panel);
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:
CellList Widget

Introduction
The CellList widget represents a single column list of cells.
**Class Declaration**

Following is the declaration for `com.google.gwt.user.cellview.client.CellList<T>` class:

```java
public class CellList<T>
    extends AbstractHasData<T>
```

**Class Constructors**

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>CellList(Cell&lt;T&gt; cell)</code></td>
</tr>
<tr>
<td></td>
<td>Construct a new CellList.</td>
</tr>
<tr>
<td>2</td>
<td><code>CellList(Cell&lt;T&gt; cell, CellList.Resources resources)</code></td>
</tr>
<tr>
<td></td>
<td>Construct a new CellList with the specified CellList.Resources.</td>
</tr>
<tr>
<td>3</td>
<td><code>CellList(Cell&lt;T&gt; cell, CellList.Resources resources, ProvidesKey&lt;T&gt; keyProvider)</code></td>
</tr>
<tr>
<td></td>
<td>Construct a new CellList with the specified CellList.Resources and key provider.</td>
</tr>
<tr>
<td>4</td>
<td><code>CellList(Cell&lt;T&gt; cell, ProvidesKey&lt;T&gt; keyProvider)</code></td>
</tr>
<tr>
<td></td>
<td>Construct a new CellList with the specified key provider.</td>
</tr>
</tbody>
</table>

**Class Methods**

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>protected boolean dependsOnSelection()</code></td>
</tr>
<tr>
<td></td>
<td>Check whether or not the cells in the view depend on the selection state.</td>
</tr>
<tr>
<td>2</td>
<td><code>protected void doSelection(Event event, T value, int indexOnPage)</code></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>3</td>
<td><strong>protected void fireEventToCell(Cell.Context context, Event event, Element parent, T value)</strong>&lt;br&gt;Fire an event to the cell.</td>
</tr>
<tr>
<td>4</td>
<td><strong>protected Cell&lt;T&gt; getCell()</strong>&lt;br&gt;Return the cell used to render each item.</td>
</tr>
<tr>
<td>5</td>
<td><strong>protected Element getCellParent(Element item)</strong>&lt;br&gt;Get the parent element that wraps the cell from the list item.</td>
</tr>
<tr>
<td>6</td>
<td><strong>protected Element getChildContainer()</strong>&lt;br&gt;Return the element that holds the rendered cells.</td>
</tr>
<tr>
<td>7</td>
<td><strong>SafeHtml getEmptyListMessage()</strong>&lt;br&gt;Get the message that is displayed when there is no data.</td>
</tr>
<tr>
<td>8</td>
<td><strong>protected Element getKeyboardSelectedElement()</strong>&lt;br&gt;Get the element that has keyboard selection.</td>
</tr>
<tr>
<td>9</td>
<td><strong>Element getRowElement(int indexOnPage)</strong>&lt;br&gt;Get the Element for the specified index.</td>
</tr>
<tr>
<td>10</td>
<td><strong>protected boolean isKeyboardNavigationSuppressed()</strong>&lt;br&gt;Check if keyboard navigation is being suppressed, such as when the user is editing a cell.</td>
</tr>
<tr>
<td>11</td>
<td><strong>protected void onBlur()</strong>&lt;br&gt;Called when the widget is blurred.</td>
</tr>
<tr>
<td>12</td>
<td><strong>protected void onBrowserEvent2(Event event)</strong>&lt;br&gt;Called after AbstractHasData.onBrowserEvent(Event) completes.</td>
</tr>
<tr>
<td>13</td>
<td><strong>protected void onFocus()</strong></td>
</tr>
</tbody>
</table>
Called when the widget is focused.

```java
14 protected void renderRowValues(SafeHtmlBuilder sb, java.util.List<T> values, int start, SelectionModel<? super T> selectionModel)
Render all row values into the specified SafeHtmlBuilder.
```

```java
15 protected boolean resetFocusOnCell()
Reset focus on the currently focused cell.
```

```java
16 void setEmptyListMessage(SafeHtml html)
Set the message to display when there is no data.
```

```java
17 protected void setKeyboardSelected(int index, boolean selected, boolean stealFocus)
Update an element to reflect its keyboard selected state.
```

```java
18 protected void setSelected(Element elem, boolean selected)
Deprecated. this method is never called by AbstractHasData, render the selected styles in renderRowValues(SafeHtmlBuilder, List, int, SelectionModel)
```

```java
19 void setValueUpdater(ValueUpdater<T> valueUpdater)
Set the value updater to use when cells modify items.
```

### Methods Inherited

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.cellview.client.AbstractHasData
- java.lang.Object

### CellList Widget Example

This example will take you through simple steps to show usage of a CellList Widget in GWT. Follow the following steps to update the GWT application we created in **GWT - Create Application** chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
1. Create a project with a name `HelloWorld` under a package `com.tutorialspoint` as explained in the *GWT - Create Application* chapter.

3. Compile and run the application to verify the result of the implemented logic.

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
  text-align: center;
  font-family: verdana, sans-serif;
}

h1{
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript"
src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>
<h1>CellList Widget Demonstration</h1>
<div id="gwtContainer"></div>
</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of CellList widget.

```java
package com.tutorialspoint.client;

import java.util.Arrays;
import java.util.List;

import com.google.gwt.cell.client.AbstractCell;
import com.google.gwt.cell.client.Cell;
import com.google.gwt.core.client.EntryPoint;
```
import com.google.gwt.safehtml.shared.SafeHtmlBuilder;
import com.google.gwt.user.cellview.client.CellList;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;
import com.google.gwt.view.client.ProvidesKey;
import com.google.gwt.view.client.SelectionModel;
import com.google.gwt.view.client.SingleSelectionModel;

public class HelloWorld implements EntryPoint {
    /**
     * A simple data type that represents a contact.
     */
    private static class Contact {
        private static int nextId = 0;
        private final int id;
        private String name;

        public Contact(String name) {
            nextId++;
            this.id = nextId;
            this.name = name;
        }
    }

    /**
     * A custom {@link Cell} used to render a {@link Contact}.
     */
    private static class ContactCell extends AbstractCell<Contact> {
        @Override
        public void render(Contact value, Object key, SafeHtmlBuilder sb) {
            if (value != null) {
                sb.appendEscaped(value.name);
            }
        }
    }
}
private static final List<Contact> CONTACTS = Arrays.asList(
    new Contact("John"), new Contact("Joe"), new Contact("Michael"),
    new Contact("Sarah"), new Contact("George"));

public void onModuleLoad() {
    /*
     * Define a key provider for a Contact. We use the unique ID
     * as the key, which allows to maintain selection even if the
     * name changes.
     */
    ProvidesKey<Contact> keyProvider = new ProvidesKey<Contact>() {
        public Object getKey(Contact item) {
            // Always do a null check.
            return (item == null) ? null : item.id;
        }
    };

    // Create a CellList using the keyProvider.
    CellList<Contact> cellList = new CellList<Contact>(new ContactCell(),
        keyProvider);

    // Push data into the CellList.
    cellList.setRowCount(CONTACTS.size(), true);
    cellList.setRowData(0, CONTACTS);

    // Add a selection model using the same keyProvider.
    SelectionModel<Contact> selectionModel
= new SingleSelectionModel<Contact>(
  keyProvider);

classList.setSelectionModel(selectionModel);

/*
 * Select a contact. The selectionModel will select based on the
 * ID because we used a keyProvider.
 */
Contact sarah = CONTACTS.get(3);
selectionModel.setSelected(sarah, true);

// Modify the name of the contact.
sarah.name = "Sara";

/*
 * Redraw the CellList. Sarah/Sara will still be selected because we
 * identify her by ID. If we did not use a keyProvider,
 * Sara would not be selected.
 */
cellList.redraw();

VerticalPanel panel = new VerticalPanel();
panel.setBorderWidth(1);
panel.setWidth("200");
panel.add(cellList);

// Add the widgets to the root panel.
RootPanel.get().add(panel);

Once you are ready with all the changes done, let us compile and run the
application in development mode as we did in GWT - Create Application chapter. If
everything is fine with your application, then this will produce the following
result:
**GWT - CellTable Widget**

**Introduction**

The **CellTable** widget represents a tabular view that supports paging and columns.

**Class Declaration**

Following is the declaration for `com.google.gwt.user.cellview.client.CellTable<T>` class:

```java
public class CellTable<T>
    extends AbstractHasData<T>
```

**Class Constructors**

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CellTable()</td>
</tr>
</tbody>
</table>
Constructs a table with a default page size of 15.

2  **CellTable(int pageSize)**  
Constructs a table with the given page size.

3  **CellTable(int pageSize, CellTable.Resources resources)**  
Constructs a table with the given page size with the specified CellTable.BasicResources.

4  **CellTable(int pageSize, CellTable.Resources resources, ProvidesKey<T> keyProvider)**  
Constructs a table with the given page size, the specified CellTable.BasicResources, and the given key provider.

5  **CellTable(int pageSize, ProvidesKey<T> keyProvider)**  
Constructs a table with the given page size and the given key provider.

6  **CellTable(ProvidesKey<T> keyProvider)**  
Constructs a table with a default page size of 15, and the given key provider.

### Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
</table>
| 1    | void addColumn(ColumnType col)  
Adds a column to the table. |
| 2    | void addColumn(ColumnType col, Header<?> header)  
Adds a column to the table with an associated header. |
| 3    | void addColumn(ColumnType col, Header<?> header, Header<?> footer)  
Adds a column to the table with an associated header and footer. |
<p>| 4    | void addColumn(ColumnType col, SafeHtml headerHtml) |</p>
<table>
<thead>

</tr>
</tbody>
</table>
Remove a style from the TableColElement at the specified index.

26 protected void renderRowValues(SafeHtmlBuilder sb, java.util.List<T> values, int start, SelectionModel<? super T> selectionModel)

Render all row values into the specified SafeHtmlBuilder.

27 protected void replaceAllChildren(java.util.List<T> values, SafeHtml html)

Replace all children with the specified html.

28 protected boolean resetFocusOnCell()

Reset focus on the currently focused cell.

29 protected void setKeyboardSelected(int index, boolean selected, boolean stealFocus)

Update an element to reflect its keyboard selected state.

30 void setRowStyles(RowStyles<T> rowStyles)

Sets the object used to determine how a row is styled; the change will take effect the next time that the table is rendered.

31 protected void setSelected(Element elem, boolean selected)

Deprecated. this method is never called by AbstractHasData, render the selected styles in renderRowValues(SafeHtmlBuilder, List, int, SelectionModel)

Methods Inherited
This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.cellview.client.AbstractHasData
- java.lang.Object

Celltable Widget Example
This example will take you through simple steps to show usage of a CellTable Widget in GWT. The following steps will help you update the GWT application which we created in GWT - Create Application chapter:
<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <code>HelloWorld</code> under a package <code>com.tutorialspoint</code> as explained in the <code>GWT - Create Application</code> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <code>HelloWorld.gwt.xml</code>, <code>HelloWorld.css</code>, <code>HelloWorld.html</code> and <code>HelloWorld.java</code> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
  text-align: center;
  font-family: verdana, sans-serif;
}
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript"
src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>

<h1>CellTable Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of CellTable widget.

```java
package com.tutorialspoint.client;

import java.util.Arrays;
import java.util.Date;
import java.util.List;
```
import com.google.gwt.cell.client.DateCell;
import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.cellview.client.CellTable;
import com.google.gwt.user.cellview.client.Column;
import com.google.gwt.user.client.ui.HasKeyboardSelectionPolicy.
import com.google.gwt.user.cellview.client.TextColumn;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;
import com.google.gwt.view.client.SelectionChangeEvent;
import com.google.gwt.view.client.SingleSelectionModel;

public class HelloWorld implements EntryPoint {
    /**
     * A simple data type that represents a contact.
     */
    private static class Contact {
        private final String address;
        private final Date birthday;
        private final String name;

        public Contact(String name, Date birthday, String address) {
            this.name = name;
            this.birthday = birthday;
            this.address = address;
        }
    }

    /**
     * The list of data to display.
     */
    private static final List<Contact> CONTACTS = Arrays.asList(
            new Contact("John", new Date(80, 4, 12), "123 Fourth Avenue"),
...
```java
new Contact("Joe", new Date(85, 2, 22), "22 Lance Ln"),
new Contact("George", new Date(46, 6, 6), "1600 Pennsylvania Avenue");

public void onModuleLoad() {
    // Create a CellTable.
    CellTable<Contact> table = new CellTable<Contact>();

table.setKeyboardSelectionPolicy(KeyboardSelectionPolicy.ENABLED);

    // Add a text column to show the name.
    TextColumn<Contact> nameColumn = new TextColumn<Contact>() {
        @Override
        public String getValue(Contact object) {
            return object.name;
        }
    };
    table.addColumn(nameColumn, "Name");

    // Add a date column to show the birthday.
    DateCell dateCell = new DateCell();
    Column<Contact, Date> dateColumn = new Column<Contact, Date>(dateCell) {
        @Override
        public Date getValue(Contact object) {
            return object.birthday;
        }
    };
    table.addColumn(dateColumn, "Birthday");

    // Add a text column to show the address.
    TextColumn<Contact> addressColumn = new TextColumn<Contact>() {
```
```java
@Override
public String getValue(Contact object) {
    return object.address;
}
};
table.addColumn(addressColumn, "Address");

// Add a selection model to handle user selection.
final SingleSelectionModel<Contact> selectionModel = new SingleSelectionModel<Contact>();
table.setSelectionModel(selectionModel);
selectionModel.addSelectionChangeHandler(new SelectionChangeEvent.Handler() {
    public void onSelectionChange(SelectionChangeEvent event) {
        Contact selected = selectionModel.getSelectedObject();
        if (selected != null) {
            Window.alert("You selected: " + selected.name);
        }
    }
});

// Set the total row count. This isn't strictly necessary,
// but it affects paging calculations, so its good habit to
// keep the row count up to date.
table.setRowCount(CONTACTS.size(), true);

// Push the data into the widget.
table.setRowData(0, CONTACTS);

VerticalPanel panel = new VerticalPanel();
panel.setBorderWidth(1);
panel.setWidth("400");
panel.add(table);
```
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

GWT - CellBrowser Widget

Introduction
The CellBrowser widget represents a browsable view of a tree in which only a single node per level may be open at one time.
Class Declaration
Following is the declaration for com.google.gwt.user.cellview.client.CellBrowser<T> class:

```java
public class CellBrowser
    extends AbstractCellTree
    implements ProvidesResize, RequiresResize, HasAnimation
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CellBrowser(TreeViewModel viewModel, T rootValue)</td>
</tr>
<tr>
<td></td>
<td>Construct a new CellBrowser.</td>
</tr>
<tr>
<td>2</td>
<td>CellBrowser(TreeViewModel viewModel, T rootValue, CellBrowser.Resources resources)</td>
</tr>
<tr>
<td></td>
<td>Construct a new CellBrowser with the specified CellBrowser.Resources.</td>
</tr>
</tbody>
</table>

Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>protected Widget createPager(HasData display)</td>
</tr>
<tr>
<td></td>
<td>Create a pager to control the list view.</td>
</tr>
<tr>
<td>2</td>
<td>int getDefaultColumnWidth()</td>
</tr>
<tr>
<td></td>
<td>Get the default width of new columns.</td>
</tr>
<tr>
<td>3</td>
<td>int getMinimumColumnWidth()</td>
</tr>
<tr>
<td></td>
<td>Get the minimum width of columns.</td>
</tr>
<tr>
<td>4</td>
<td>TreeNode getRootTreeNode()</td>
</tr>
<tr>
<td></td>
<td>Get the root TreeNode.</td>
</tr>
<tr>
<td>5</td>
<td>boolean isAnimationEnabled()</td>
</tr>
</tbody>
</table>
Returns true if animations are enabled, false if not.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
</table>
| 6 | `void onBrowserEvent(Event event)`  
Fired whenever a browser event is received. |
| 7 | `void onResize()`  
This method must be called whenever the implementor's size has been modified. |
| 8 | `void setAnimationEnabled(boolean enable)`  
Enable or disable animations. |
| 9 | `void setDefaultColumnWidth(int width)`  
Set the default width of new columns. |
| 10 | `void set Keyboard Selection Policy (Has Keyboard Selection Policy.KeyboardSelectionPolicy policy)`  
Set the HasKeyboardSelectionPolicy.KeyboardSelectionPolicy. |
| 11 | `void setMinimumColumnWidth(int minWidth)`  
Set the minimum width of columns. |

**Methods Inherited**

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Composite
- com.google.gwt.user.cellview.client.AbstractCellTree
- java.lang.Object

**Cellbrowser Widget Example**

This example will take you through simple steps to show usage of a CellBrowser Widget in GWT. Follow the following steps to update the GWT application we created in *GWT - Create Application* chapter:
<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <code>com.tutorialspoint</code> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml</em>, <em>HelloWorld.css</em>, <em>HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
  /* Styling content */
}
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript"
src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>

<h1>CellBrowser Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of CellBrowser widget.

```java
package com.tutorialspoint.client;

import java.util.ArrayList;
```
import java.util.List;

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:
Layout Panels can contain other widgets. These panels control the way widgets are shown on the User Interface. Every Panel widget inherits properties from the Panel class which in turn inherits properties from the Widget class and which in turn inherits properties from the UIObject class.

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Widget &amp; Description</th>
</tr>
</thead>
</table>
| 1    | **GWT UIObject Class**  
This widget contains text, not interpreted as HTML using a `<div>` element, causing it to be displayed with block layout. |
| 2    | **GWT Widget Class**  
This widget can contain HTML text and displays the HTML content using a `<div>` element, causing it to be displayed with block layout. |
| 3    | **GWT Panel Class**  
This is an abstract base class for all panels, which are widgets that can contain other widgets. |

### GWT - UIObject Class

**Introduction**

The class **UIObject** is the superclass for all user-interface objects. It simply wraps a DOM element, and cannot receive events. It provides direct child classes like Widget, MenuItem, MenuItemSeparator, TreeItem.

- All uiobject objects can be styled using css.
- Every uiobject has a primary style name that identifies the key css style rule that should always be applied to it.
- More complex styling behaviour can be achieved by manipulating an object's secondary style name.

**Class Declaration**

Following is the declaration for **com.google.gwt.user.client.ui.UIObject** class:
GWT

public abstract class UIObject
    extends java.lang.Object

Field
Following are the fields for com.google.gwt.user.client.ui.UIObject class:

public static final java.lang.String DEBUG_ID_PREFIX -- The element ID that you specify will be prefixed by the static string DEBUG_ID_PREFIX.

Methods Inherited
This class inherits methods from the following classes:

- java.lang.Object

GWT - Widget Class

Introduction
The class Widget is the base class for the majority of user-interface objects. Widget adds support for receiving events from the browser and being added directly to panels.

Class Declaration
Following is the declaration for com.google.gwt.user.client.ui.Widget class:

```java
public class Widget
    extends UIObject
    implements EventListener
```

Field
Following are the fields for com.google.gwt.user.client.ui.Widget class:

- `public static final java.lang.String DEBUG_ID_PREFIX` -- The element ID that you specify will be prefixed by the static string DEBUG_ID_PREFIX.

Class Constructors

**Methods inherited**

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject

**GWT - Panel Class**

**Introduction**

The class Panel is the abstract base class for all panels, which are widgets that can contain other widgets.

**Class Declaration**

Following is the declaration for com.google.gwt.user.client.ui.Panel class:

```java
public abstract class Panel
```
extends Widget

implements HasWidgets.ForIsWidget

Field
Following are the fields for `com.google.gwt.user.client.ui.Panel` class:

- **public static final java.lang.String DEBUG_ID_PREFIX** -- The element ID that you specify will be prefixed by the static string DEBUG_ID_PREFIX.

### Methods Inherited

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget

### Layout Panels

Following are few important *Layout Panels*:

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Widget &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><strong>FlowPanel</strong></td>
</tr>
<tr>
<td></td>
<td>This widget represents a panel that formats its child widgets using the default HTML layout behavior.</td>
</tr>
<tr>
<td>2</td>
<td><strong>HorizontalPanel</strong></td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td>---</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| 3 | **VerticalPanel**  
   This widget represents a panel that lays all of its widgets out in a single vertical column. |
| 4 | **HorizontalSplitPanel**  
   This widget represents a panel that arranges two widgets in a single horizontal row and allows the user to interactively change the proportion of the width dedicated to each of the two widgets. Widgets contained within a HorizontalSplitPanel will be automatically decorated with scrollbars when necessary. |
| 5 | **VerticalSplitPanel**  
   This widget represents a panel that arranges two widgets in a single vertical column and allows the user to interactively change the proportion of the height dedicated to each of the two widgets. Widgets contained within a VerticalSplitPanel will be automatically decorated with scrollbars when necessary. |
| 6 | **FlexTable**  
   This widget represents a flexible table that creates cells on demand. It can be jagged (that is, each row can contain a different number of cells) and individual cells can be set to span multiple rows or columns. |
| 7 | **Grid**  
   This widget represents a rectangular grid that can contain text, html, or a child Widget within its cells. It must be resized explicitly to the desired number of rows and columns. |
| 8 | **DeckPanel**  
   This widget represents a panel that displays all of its child widgets in a 'deck', where only one can be visible at a time. It is used by TabPanel. |
| 9 | **DockPanel**  
   This widget represents a panel that lays its child widgets out "docked" at its outer edges, and allows its last widget to take up the remaining space in its center. |
<table>
<thead>
<tr>
<th></th>
<th><strong>Widget</strong></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td><strong>HTMLPanel</strong></td>
<td>This widget represents a panel that contains HTML, and which can attach child widgets to identified elements within that HTML.</td>
</tr>
<tr>
<td>11</td>
<td><strong>TabPanel</strong></td>
<td>This widget represents a panel that represents a tabbed set of pages, each of which contains another widget. Its child widgets are shown as the user selects the various tabs associated with them. The tabs can contain arbitrary HTML.</td>
</tr>
<tr>
<td>12</td>
<td><strong>Composite</strong></td>
<td>This widget represents a type of widget that can wrap another widget, hiding the wrapped widget's methods. When added to a panel, a composite behaves exactly as if the widget it wraps had been added.</td>
</tr>
<tr>
<td>13</td>
<td><strong>SimplePanel</strong></td>
<td>This widget represents a Base class for panels that contain only one widget.</td>
</tr>
<tr>
<td>14</td>
<td><strong>ScrollPanel</strong></td>
<td>This widget represents a simple panel that wraps its contents in a scrollable area.</td>
</tr>
<tr>
<td>15</td>
<td><strong>FocusPanel</strong></td>
<td>This widget represents a simple panel that makes its contents focusable, and adds the ability to catch mouse and keyboard events.</td>
</tr>
<tr>
<td>16</td>
<td><strong>FormPanel</strong></td>
<td>This widget represents a panel that wraps its contents in an HTML <code>&lt;FORM&gt;</code> element.</td>
</tr>
<tr>
<td>17</td>
<td><strong>PopupPanel</strong></td>
<td>This widget represents a panel that can pop up over other widgets. It overlays the browser's client area (and any previously-created popups).</td>
</tr>
<tr>
<td>18</td>
<td><strong>DialogBox</strong></td>
<td>This widget represents a form of popup that has a caption area at the</td>
</tr>
</tbody>
</table>
GWT - FlowPanel Widget

Introduction

The FlowPanel widget represents a panel that formats its child widgets using the default HTML layout behavior.

Class Declaration

Following is the declaration for com.google.gwt.user.client.ui.FlowPanel class:

```java
public class FlowPanel
    extends ComplexPanel
    implements InsertPanel.ForIsWidget
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>FlowPanel()</td>
</tr>
<tr>
<td></td>
<td>Constructor for empty Flow Panel.</td>
</tr>
</tbody>
</table>

Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>void add(Widget w)</td>
</tr>
<tr>
<td></td>
<td>Adds a new child widget to the panel.</td>
</tr>
<tr>
<td>2</td>
<td>void clear()</td>
</tr>
<tr>
<td></td>
<td>Removes all child widgets.</td>
</tr>
</tbody>
</table>
void insert(IsWidget w, int beforeIndex)

void insert(Widget w, int beforeIndex)

Inserts a widget before the specified index.

Methods Inherited

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Panel
- com.google.gwt.user.client.ui.ComplexPanel
- java.lang.Object

FlowPanel Widget Example

This example will take you through simple steps to show usage of a FlowPanel Widget in GWT. The following steps will help you update the GWT application which we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.

```xml
<xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
    <!-- Inherit the core Web Toolkit stuff. -->
    <inherits name='com.google.gwt.user.User'/>
</module>
```
<!-- Inherit the default GWT style sheet. -->
<inherits name='com.google.gwt.user.theme.clean.Clean'/>

<!-- Specify the app entry point class. -->
<entry-point class='com.tutorialspoint.client.HelloWorld'/>

<!-- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>

</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

body{
    text-align: center;
    font-family: verdana, sans-serif;
}
h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}
.gwt-CheckBox {
    margin: 10px;
}

Following is the content of the modified HTML host file war/HelloWorld.html.

<html>
<head>
<title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript" src="helloworld/helloworld.nocache.js">
</html>
Let us have following content of Java file **src/com.tutorialspoint/HelloWorld.java** which will demonstrate use of FlowPanel widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.CheckBox;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.FlowPanel;
import com.google.gwt.user.client.ui.RootPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        // Create a flow panel
        FlowPanel flowPanel = new FlowPanel();

        // Add Check Boxes to flow Panel
        for(int i = 1; i <= 10; i++){
            CheckBox checkBox = new CheckBox("Item" + i);
            flowPanel.add(checkBox);
        }

        DecoratorPanel decoratorPanel = new DecoratorPanel();
    }
}
```
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, this will produce the following result:

![FlowPanel Widget Demonstration](image)

### GWT - HorizontalPanel Widget

#### Introduction

The **HorizontalPanel** widget represents a panel that lays all of its widgets out in a single horizontal column.
Class Declaration

Following is the declaration for com.google.gwt.user.client.ui.HorizontalPanel class:

```java
public class HorizontalPanel
    extends CellPanel
    implements HasAlignment, InsertPanel.ForIsWidget
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>HorizontalPanel()</td>
</tr>
<tr>
<td></td>
<td>Constructor for empty horizontal Panel.</td>
</tr>
</tbody>
</table>

Class methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>void add(Widget w)</td>
</tr>
<tr>
<td></td>
<td>Adds a child widget.</td>
</tr>
<tr>
<td>2</td>
<td>HasHorizontalAlignment.HorizontalAlignmentConstant getHorizontalAlignment()</td>
</tr>
<tr>
<td></td>
<td>Gets the horizontal alignment.</td>
</tr>
<tr>
<td>3</td>
<td>HasVerticalAlignment.VerticalAlignmentConstant getVerticalAlignment()</td>
</tr>
<tr>
<td></td>
<td>Gets the vertical alignment.</td>
</tr>
<tr>
<td>4</td>
<td>void insert(IsWidget w, int beforeIndex)</td>
</tr>
<tr>
<td>5</td>
<td>void insert(Widget w, int beforeIndex)</td>
</tr>
<tr>
<td></td>
<td>Inserts a child widget before the specified index.</td>
</tr>
<tr>
<td>6</td>
<td>protected void onEnsureDebugId(java.lang.String baseID)</td>
</tr>
<tr>
<td></td>
<td>Affected Elements: -# = the cell at the given index.</td>
</tr>
</tbody>
</table>
7. boolean remove(Widget w)
   Removes a child widget.

8. void set Horizontal Alignment(Has Horizontal Alignment.HorizontalAlignment Constant align)
   Sets the default horizontal alignment to be used for widgets added to this panel.

9. void setVerticalAlignment(HasVerticalAlignment.VerticalAlignmentConstant align)
   Sets the default vertical alignment to be used for widgets added to this panel.

**Methods inherited**
This class inherits methods from the following classes:
- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Panel
- com.google.gwt.user.client.ui.ComplexPanel
- com.google.gwt.user.client.ui.CellPanel
- java.lang.Object

**HorizontalPanel Widget Example**
This example will take you through simple steps to show usage of a HorizontalPanel Widget in GWT. The following steps will help you to update the GWT application which we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify HelloWorld.gwt.xml, HelloWorld.css, HelloWorld.html and HelloWorld.java as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>
Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/> 
  
  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/> 
  
  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/> 
  
  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
  text-align: center;
  font-family: verdana, sans-serif;
}

h1{
  font-size: 2em;
  font-weight: bold;
  color: #777777;
  margin: 40px 0px 70px;
  text-align: center;
}

gwt-CheckBox {
  margin: 10px;
}
```

Following is the content of the modified HTML host file `war/HelloWorld.html`. 

---

276
<html>
<head>
<title>Hello World</title>

<script language="javascript"
src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>
<h1>HorizontalPanel Widget Demonstration</h1>
<div id="gwtContainer"></div>
</body>
</html>

Let us have following content of Java file src/com.tutorialspoint/HelloWorld.java which will demonstrate use of HorizontalPanel widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.CheckBox;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.HorizontalPanel;
import com.google.gwt.user.client.ui.RootPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        // Create a horizontal panel
        HorizontalPanel horizontalPanel = new HorizontalPanel();

        // Add CheckBoxes to horizontal Panel
        for(int i = 1; i <= 10; i++){
```
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

**GWT - VerticalPanel Widget**

**Introduction**

The **VerticalPanel** widget represents a panel that lays all of its widgets out in a single vertical row.

**Class Declaration**

Following is the declaration for com.google.gwt.user.client.ui.VerticalPanel class:

```java
public class VerticalPanel
```

extends CellPanel
implements HasAlignment, InsertPanel.ForIsWidget

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>

</tr>
<tr>
<td></td>
<td>Removes a child widget.</td>
</tr>
<tr>
<td>8</td>
<td>void set Horizontal Alignment (Has Horizontal Alignment.Horizontal</td>
</tr>
</tbody>
</table>
Alignment Constant align
Sets the default horizontal alignment to be used for widgets added to this panel.

<table>
<thead>
<tr>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>void set Vertical Alignment (Has Vertical Alignment Vertical Alignment Constant align)</td>
</tr>
<tr>
<td>Sets the default vertical alignment to be used for widgets added to this panel.</td>
</tr>
</tbody>
</table>

### Methods Inherited
This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Panel
- com.google.gwt.user.client.ui.ComplexPanel
- com.google.gwt.user.client.ui.CellPanel
- java.lang.Object

### VerticalPanel Widget Example
This example will take you through simple steps to show usage of a VerticalPanel Widget in GWT. The following steps will help to you update the GWT application which we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <em>com.tutorialspoint</em> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml</em>, <em>HelloWorld.css</em>, <em>HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptors src/com.tutorialspoint/HelloWorld.gwt.xml.

```xml
<?xml version="1.0" encoding="UTF-8"?>
```
Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

body{
  text-align: center;
  font-family: verdana, sans-serif;
}

h1{
  font-size: 2em;
  font-weight: bold;
  color: #777777;
  margin: 40px 0px 70px;
  text-align: center;
}

.gwt-CheckBox {
  margin: 10px;
}

Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/> 

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/> 

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/> 

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```
Let us have following content of Java file src/com.tutorialspoint/HelloWorld.java which will demonstrate use of VerticalPanel widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.CheckBox;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.VerticalPanel;
import com.google.gwt.user.client.ui.RootPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        // Create a vertical panel
        VerticalPanel verticalPanel = new VerticalPanel();

        // Add CheckBoxes to vertical Panel
```
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

```java
for(int i = 1; i <= 10; i++){
    CheckBox checkBox = new CheckBox("Item" + i);
    verticalPanel.add(checkBox);
}

DecoratorPanel decoratorPanel = new DecoratorPanel();
decoratorPanel.add(verticalPanel);

// Add the widgets to the root panel.
RootPanel.get().add(decoratorPanel);
}
```
GWT - HorizontalSplitPanel Widget

Introduction

The `HorizontalSplitPanel` widget represents a panel that arranges two widgets in a single horizontal row and allows the user to interactively change the proportion of the width dedicated to each of the two widgets. Widgets contained within a `HorizontalSplitPanel` will be automatically decorated with scrollbars when necessary.

Class Declaration

Following is the declaration for `com.google.gwt.user.client.ui.HorizontalSplitPanel` class:

```java
@Deprecated
```
public final class HorizontalSplitPanel
    extends Panel

CSS Style Rules
Following default CSS Style rules will be applied to all the HorizontalSplitPanel widget. You can override it as per your requirements.

```
.gwt-HorizontalSplitPanel {
}
.gwt-HorizontalSplitPanel hsplitter {
}
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>HorizontalSplitPanel()</td>
</tr>
<tr>
<td></td>
<td>Deprecated.</td>
</tr>
<tr>
<td>2</td>
<td>HorizontalSplitPanel(HorizontalSplitPanel.Resources resources)</td>
</tr>
<tr>
<td></td>
<td>Deprecated. Creates an empty horizontal split panel.</td>
</tr>
<tr>

</tbody>
</table>

**Methods Inherited**

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Panel
- java.lang.Object
**HorizontalSplitPanel Widget Example**

This example will take you through simple steps to show usage of a HorizontalSplitPanel Widget in GWT. The following steps will help you update the GWT application which we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <em>com.tutorialspoint</em> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml, HelloWorld.css, HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`. 

GWT

Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript" src="helloworld/helloworld.nocache.js"></script>
</head>
<body>

<h1>HorizontalSplitPanel Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of `HorizontalSplitPanel` widget.

```java
package com.tutorialspoint.client;
```
import com.google.gwt.core.client EntryPoint;
import com.google.gwt.user.client.ui CheckBox;
import com.google.gwt.user.client.ui DecoratorPanel;
import com.google.gwt.user.client.ui HTML;
import com.google.gwt.user.client.ui HorizontalSplitPanel;
import com.google.gwt.user.client.ui RootPanel;
import com.google.gwt.user.client.ui VerticalPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        // Create a Horizontal Split Panel
        HorizontalSplitPanel horizontalSplitPanel = new HorizontalSplitPanel();
        horizontalSplitPanel.setSize("300px", "200px");
        horizontalSplitPanel.setSplitPosition("30");

        // Add some content
        String randomText = "This is a sample text.";
        for (int i = 0; i < 2; i++) {
            randomText += randomText;
        }
        horizontalSplitPanel.setRightWidget(new HTML(randomText));
        horizontalSplitPanel.setLeftWidget(new HTML(randomText));

        DecoratorPanel decoratorPanel = new DecoratorPanel();
        decoratorPanel.add(horizontalSplitPanel);
        // Add the widgets to the root panel.
        RootPanel.get().add(decoratorPanel);
    }
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:
GWT - VerticalSplitPanel Widget

Introduction

The **VerticalSplitPanel** widget represents a panel that arranges two widgets in a single vertical column and allows the user to interactively change the proportion of the height dedicated to each of the two widgets. Widgets contained within a VerticalSplitterPanel will be automatically decorated with scrollbars when necessary.

Class Declaration

Following is the declaration for `com.google.gwt.user.client.ui.VerticalSplitPanel` class:

```java
@Deprecated
public final class VerticalSplitPanel
```
extends Panel

**CSS Style Rules**

Following default CSS Style rules will be applied to all the VerticalSplitPanel widget. You can override it as per your requirements.

```
.gwt-VerticalSplitPanel { }
.gwt-VerticalSplitPanel vsplitter { }
```

**Class Constructors**

<table>

</tr>
</tbody>
</table>

**Methods Inherited**

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Panel
- java.lang.Object

**VerticalSplitPanel Widget Example**

This example will take you through simple steps to show usage of a VerticalSplitPanel Widget in GWT. The following steps will help to you update the GWT application which we created in GWT - *Create Application* chapter:
Step | Description
---|---
1 | Create a project with a name *HelloWorld* under a package *com.tutorialspoint* as explained in the *GWT - Create Application* chapter.
2 | Modify *HelloWorld.gwt.xml*, *HelloWorld.css*, *HelloWorld.html* and *HelloWorld.java* as explained below. Keep rest of the files unchanged.
3 | Compile and run the application to verify the result of the implemented logic.

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
    <!-- Inherit the core Web Toolkit stuff. -->
    <inherits name='com.google.gwt.user.User'/>

    <!-- Inherit the default GWT style sheet. -->
    <inherits name='com.google.gwt.user.theme.clean.Clean'/>

    <!-- Specify the app entry point class. -->
    <entry-point class='com.tutorialspoint.client.HelloWorld'/>

    <!-- Specify the paths for translatable code -->
    <source path='client'/>
    <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript" src="helloworld/helloworld.nocache.js"></script>
</head>
<body>
<h1>VerticalSplitPanel Widget Demonstration</h1>
<div id="gwtContainer"></div>
</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of VerticalSplitPanel widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.CheckBox;
import com.google.gwt.user.client.ui.DecoratorPanel;
```
import com.google.gwt.user.client.ui.HTML;
import com.google.gwt.user.client.ui.VerticalSplitPanel;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        // Create a Vertical Split Panel
        VerticalSplitPanel verticalSplitPanel = new VerticalSplitPanel();
        verticalSplitPanel.setSize("300px", "200px");
        verticalSplitPanel.setSplitPosition("35%");

        // Add some content
        String randomText = "This is a sample text.";
        for (int i = 0; i < 2; i++) {
            randomText += randomText;
        }
        verticalSplitPanel.setBottomWidget(new HTML(randomText));
        verticalSplitPanel.setTopWidget(new HTML(randomText));

        DecoratorPanel decoratorPanel = new DecoratorPanel();
        decoratorPanel.add(verticalSplitPanel);
        // Add the widgets to the root panel.
        RootPanel.get().add(decoratorPanel);
    }
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, this this will produce the following result:
GWT - FlexTable Widget

Introduction

The FlexTable widget represents a flexible table that creates cells on demand. It can be jagged (that is, each row can contain a different number of cells) and individual cells can be set to span multiple rows or columns.

Class Declaration

Following is the declaration for com.google.gwt.user.client.ui.FlowPanel class:

```java
public class FlexTable
    extends HTMLTable
```
### Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>FlexTable()</td>
</tr>
<tr>
<td></td>
<td>Constructor for empty Flex Table.</td>
</tr>
</tbody>
</table>

### Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>void addCell(int row)</td>
</tr>
<tr>
<td></td>
<td>Appends a cell to the specified row.</td>
</tr>
<tr>
<td>2</td>
<td>int getCellCount(int row)</td>
</tr>
<tr>
<td></td>
<td>Gets the number of cells on a given row.</td>
</tr>
<tr>
<td>3</td>
<td>FlexTable.FlexCellFormatter getFlexCellFormatter()</td>
</tr>
<tr>
<td></td>
<td>Explicitly gets the FlexTable.FlexCellFormatter.</td>
</tr>
<tr>
<td>4</td>
<td>int getRowCount()</td>
</tr>
<tr>
<td></td>
<td>Gets the number of rows.</td>
</tr>
<tr>
<td>5</td>
<td>void insertCell(int beforeRow, int beforeColumn)</td>
</tr>
<tr>
<td></td>
<td>Inserts a cell into the FlexTable.</td>
</tr>
<tr>
<td>6</td>
<td>int insertRow(int beforeRow)</td>
</tr>
<tr>

<td>Inserts a row into the FlexTable.</td>
</tr>
<tr>
<td>7</td>
<td>protected void prepareCell(int row, int column)</td>
</tr>
<tr>
<td></td>
<td>Ensure that the cell exists.</td>
</tr>
<tr>
<td>8</td>
<td>protected void prepareRow(int row)</td>
</tr>
<tr>
<td></td>
<td>Ensure that the row exists.</td>
</tr>
<tr>
<td>9</td>
<td>void removeAllRows()</td>
</tr>
</tbody>
</table>
Remove all rows in this table.

10 void removeCell(int row, int col)
Removes the specified cell from the table.

11 void removeCells(int row, int column, int num)
Removes a number of cells from a row in the table.

12 void removeRow(int row)
Removes the specified row from the table.

Methods Inherited
This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Panel
- com.google.gwt.user.client.ui.HTMLTable
- java.lang.Object

Flextable Widget Example
This example will take you through simple steps to show usage of a FlexTable Widget in GWT. The following steps will help you update the GWT application which we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>

<source path='client'/>
<source path='shared'/>
</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}

.flexTable td {
    border: 1px solid #BBBBBB;
    padding: 3px;
}
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript"
src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>
<h1>FlexTable Widget Demonstration</h1>
<div id="gwtContainer"></div>
</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of FlexTable widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.user.client.ui.Button;
import com.google.gwt.user.client.ui.DecoratorPanel;
```
import com.google.gwt.user.client.ui.FlexTable;
import com.google.gwt.user.client.ui.FlexTable.FlexCellFormatter;
import com.google.gwt.user.client.ui.HasHorizontalAlignment;
import com.google.gwt.user.client.ui.HasVerticalAlignment;
import com.google.gwt.user.client.ui.Image;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        // Create a Flex Table
        final FlexTable flexTable = new FlexTable();
        FlexCellFormatter cellFormatter = flexTable.getFlexCellFormatter();
        flexTable.addStyleName("flexTable");
        flexTable.setWidth("32em");
        flexTable.setCellSpacing(5);
        flexTable.setCellPadding(3);

        // Add some text
        cellFormatter.setHorizontalAlignment(0, 1, HasHorizontalAlignment.ALIGN_LEFT);
        flexTable.setHTML(0, 0, "This is a FlexTable that supports" + " <b>colspans</b> and <b>rowspans</b>.");
        cellFormatter.setColSpan(0, 0, 2);

        // Add a button that will add more rows to the table
        Button addButton = new Button("Add a Row");
        addButton.addClickHandler(new ClickHandler() {
            @Override
        });
    }
}
public void onClick(ClickEvent event) {
    addRow(flexTable);
}

addRowButton.addStyleName("fixedWidthButton");

// Add a button that will add more rows to the table
Button removeRowButton = new Button("Remove a Row");
removeRowButton.addClickHandler(new ClickHandler() {
    @Override
    public void onClick(ClickEvent event) {
        removeRow(flexTable);
    }
});

removeRowButton.addStyleName("fixedWidthButton");

VerticalPanel buttonPanel = new VerticalPanel();
buttonPanel.setStyleName("flexTable-buttonPanel");
buttonPanel.add(addRowButton);
buttonPanel.add(removiRowButton);
fexTable.setWidget(0, 1, buttonPanel);
cellFormatter.setVerticalAlignment(0, 1, HasVerticalAlignment.ALIGN TOP);

// Add two rows to start
addRow(flexTable);
addRow(flexTable);

// Add the widgets to the root panel.
RootPanel.get().add(flexTable);
/**
 * Add a row to the flex table.
 */
private void addRow(FlexTable flexTable) {
    int numRows = flexTable.getRowCount();
    flexTable.setWidget(numRows, 0,
            new Image("http://www.tutorialspoint.com/images/gwt-mini.png"));
    flexTable.setWidget(numRows, 1,
            new Image("http://www.tutorialspoint.com/images/gwt-mini.png"));
    flexTable.getFlexCellFormatter().setRowSpan(0, 1, numRows + 1);
}

/**
 * Remove a row from the flex table.
 */
private void removeRow(FlexTable flexTable) {
    int numRows = flexTable.getRowCount();
    if (numRows > 1) {
        flexTable.removeRow(numRows - 1);
        flexTable.getFlexCellFormatter().setRowSpan(0, 1, numRows - 1);
    }
}

Once you are ready with all the changes done, let us compile and run the
application in development mode as we did in GWT - Create Application chapter. If
everything is fine with your application, then this will produce the following
result:
GWT - Grid Widget

Introduction
The Grid widget represents a rectangular grid that can contain text, html, or a child Widget within its cells. It must be resized explicitly to the desired number of rows and columns.

Class Declaration
Following is the declaration for com.google.gwt.user.client.ui.Grid class:

```java
public class Grid
        extends HTMLTable
```

Class constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
</table>

306
1  **Grid()**  
Constructor for Grid.

2  **Grid(int rows, int columns)**  
Constructor for Grid with requested size.

## Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
</table>
| 1    | boolean clearCell(int row, int column)  
Replaces the contents of the specified cell with a single space. |
| 2    | protected Element createCell()  
Creates a new, empty cell. |
| 3    | int getCellCount(int row)  
Return number of columns. |
| 4    | int getColumnCount()  
Gets the number of columns in this grid. |
| 5    | int getRowCount()  
Return number of rows. |
| 6    | int insertRow(int beforeRow)  
Inserts a new row into the table. |
| 7    | protected void prepareCell(int row, int column)  
Checks that a cell is a valid cell in the table. |
| 8    | protected void prepareColumn(int column)  
Checks that the column index is valid. |
<p>| 9    | protected void prepareRow(int row) |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
</table>
| 10 | void removeRow(int row)  
Removes the specified row from the table. |
| 11 | void resize(int rows, int columns)  
Resizes the grid. |
| 12 | void resizeColumns(int columns)  
Resizes the grid to the specified number of columns. |
| 13 | void resizeRows(int rows)  
Resizes the grid to the specified number of rows. |

**Methods Inherited**

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Panel
- com.google.gwt.user.client.ui.HTMLTable
- java.lang.Object

**Grid Widget Example**

This example will take you through simple steps to show usage of a Grid Widget in GWT. The following steps will help to you update the GWT application which we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>
Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>

<!-- Inherit the core Web Toolkit stuff. -->
<inherits name='com.google.gwt.user.User'/> 

<!-- Inherit the default GWT style sheet. -->
<inherits name='com.google.gwt.user.theme.clean.Clean'/> 

<!-- Specify the app entry point class. -->
<entry-point class='com.tutorialspoint.client.HelloWorld'/> 

<!-- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>

</module>
```

Following is the content of the modified Style Sheet file war/HelloWorld.css.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}
```

Following is the content of the modified HTML host file war/HelloWorld.html.

```html
<html>
```
Let us have following content of Java file
src/com.tutorialspoint/HelloWorld.java which will demonstrate use of Grid widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.Grid;
import com.google.gwt.user.client.ui.Image;
import com.google.gwt.user.client.ui.RootPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        // Create a grid
        Grid grid = new Grid(2, 2);

        // Add images to the grid
        int numRows = grid.getRowCount();
    }
}
```
int numColumns = grid.getColumnCount();
for (int row = 0; row < numRows; row++) {
    for (int col = 0; col < numColumns; col++) {
        grid.setWidget(row, col,
                        new Image("http://www.tutorialspoint.com/images/gwt-mini.png"));
    }
}

DecoratorPanel decoratorPanel = new DecoratorPanel();
decoratorPanel.add(grid);
// Add the widgets to the root panel.
RootPanel.get().add(decoratorPanel);
}
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:
**GWT - DeckPanel Widget**

**Introduction**

The **DeckPanel** widget represents a panel that displays all of its child widgets in a 'deck', where only one can be visible at a time. It is used by TabPanel.

**Class Declaration**

Following is the declaration for `com.google.gwt.user.client.ui.DeckPanel` class:

```java
public class DeckPanel
    extends ComplexPanel
    implements HasAnimation, InsertPanel, ForIsWidget
```

**Class Constructors**

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
</table>

---

### Methods Inherited

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Panel
- com.google.gwt.user.client.ui.ComplexPanel
Deckpanel Widget Example

This example will take you through simple steps to show usage of a DeckPanel Widget in GWT. Follow the following steps to update the GWT application we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify HelloWorld.gwt.xml, HelloWorld.css, HelloWorld.html and HelloWorld.java as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```
Following is the content of the modified Style Sheet file \texttt{war/HelloWorld.css}.

Body

\begin{verbatim}
{
    text-align: center;
    font-family: verdana, sans-serif;
}
h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}
.deckpanel {
    border: 1px solid #BBBBBB;
    padding: 3px;
}
\end{verbatim}

Following is the content of the modified HTML host file \texttt{war/HelloWorld.html}.

\begin{verbatim}
<html>
<head>
<title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript"
        src="helloworld/helloworld.nocache.js">
    </script>
</head>
<body>

<h1>DeckPanel Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
\end{verbatim}
Let us have following content of Java file src/com.tutorialspoint/HelloWorld.java which will demonstrate use of DeckPanel widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.user.client.ui.Button;
import com.google.gwt.user.client.ui.DeckPanel;
import com.google.gwt.user.client.ui.HorizontalAlignment;
import com.google.gwt.user.client.ui.Label;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        // Create DeckPanel widget
        final DeckPanel deckPanel = new DeckPanel();
        deckPanel.setSize("300px", "120px");
        deckPanel.setStyleName("deckpanel");
        // Create labels to add to deckpanel
        Label label1 = new Label("This is first Page");
        Label label2 = new Label("This is second Page");
        Label label3 = new Label("This is third Page");
        // Add labels to deckpanel
        deckPanel.add(label1);
        deckPanel.add(label2);
        deckPanel.add(label3);
    }
}
```
//show first label
deckPanel.showWidget(0);

//create button bar
HorizontalPanel buttonBar = new HorizontalPanel();
buttonBar.setSpacing(5);

// create button and add click handlers
// show different labels on click of different buttons
Button button1 = new Button("Page 1");
button1.addClickHandler(new ClickHandler() {
    @Override
    public void onClick(ClickEvent event) {
        deckPanel.showWidget(0);
    }
});

Button button2 = new Button("Page 2");
button2.addClickHandler(new ClickHandler() {
    @Override
    public void onClick(ClickEvent event) {
        deckPanel.showWidget(1);
    }
});

Button button3 = new Button("Page 3");
button3.addClickHandler(new ClickHandler() {
    @Override
    public void onClick(ClickEvent event) {
        deckPanel.showWidget(2);
    }
});

buttonBar.add(button1);
buttonBar.add(button2);
buttonBar.add(button3);

VerticalPanel vPanel = new VerticalPanel();
vPanel.add(deckPanel);
vPanel.add(buttonBar);

// Add the widgets to the root panel.
RootPanel.get().add(vPanel);
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:
Introduction
The DockPanel widget represents a panel that lays its child widgets out "docked" at its outer edges, and allows its last widget to take up the remaining space in its center.

Class Declaration
Following is the declaration for com.google.gwt.user.client.ui.DockPanel class:

```java
@Deprecated
public class DockPanel
    extends CellPanel
    implements HasAlignment
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>DockPanel()</td>
</tr>
<tr>
<td></td>
<td>Constructor for DockPanel.</td>
</tr>
</tbody>
</table>

Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>void add(Widget widget, DockPanel.DockLayoutConstant direction)</td>
</tr>
<tr>
<td>2</td>
<td>HasHorizontalAlignment.HorizontalAlignmentConstant getHorizontalAlignment()</td>
</tr>
<tr>
<td>3</td>
<td>HasVerticalAlignment.VerticalAlignmentConstant getVerticalAlignment()</td>
</tr>
</tbody>
</table>
|   | DockPanel.DockLayoutConstant getWidgetDirection(Widget w)  
|   | Deprecated. Gets the layout direction of the given child widget.  
| 5 | protected void onEnsureDebugId(java.lang.String baseID)  
|   | Deprecated. DockPanel supports adding more than one cell in a direction, so an integer will be appended to the end of the debug id.  
| 6 | boolean remove(Widget w)  
|   | Deprecated. Removes a child widget.  
| 7 | void setCellHeight(Widget w, java.lang.String height)  
|   | Deprecated. Sets the height of the cell associated with the given widget, related to the panel as a whole.  
| 8 | void setCellHorizontal Alignment(Widget w, Has Horizontal Alignment. Horizontal Alignment Constant align)  
|   | Deprecated. Sets the horizontal alignment of the given widget within its cell.  
| 9 | void setCellVertical Alignment (Widget w, HasVertical Alignment. Vertical Alignment Constant align)  
|   | Deprecated. Sets the vertical alignment of the given widget within its cell.  
| 10 | void setCellWidth(Widget w, java.lang.String width)  
|   | Deprecated. Sets the width of the cell associated with the given widget, related to the panel as a whole.  
| 11 | void setHorizontal Alignment (Has Horizontal Alignment. Horizontal Alignment Constant align)  
|   | Deprecated. Sets the default horizontal alignment to be used for widgets added to this panel.  
| 12 | void setVerticalAlignment(HasVerticalAlignment.VerticalAlignmentConstant align)  
|   | Deprecated. Sets the default vertical alignment to be used for widgets added to this panel.

Methods Inherited

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Panel
- com.google.gwt.user.client.ui.ComplexPanel
- com.google.gwt.user.client.ui.CellPanel
- java.lang.Object

Dockpanel Widget Example

This example will take you through simple steps to show usage of a DockPanel Widget in GWT. The following steps will help to you update the GWT application which we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <em>com.tutorialspoint</em> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml</em>, <em>HelloWorld.css</em>, <em>HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor *src/com.tutorialspoint/HelloWorld.gwt.xml*.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>

<!-- Inherit the core Web Toolkit stuff. -->
<inherits name='com.google.gwt.user.User'/>

<!-- Inherit the default GWT style sheet. -->
<inherits name='com.google.gwt.user.theme.clean.Clean'/>

<!-- Specify the app entry point class. -->
<entry-point class='com.tutorialspoint.client.HelloWorld'/>
```
Specify the paths for translatable code
<source path='client'/>
<source path='shared'/>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

body{
    text-align: center;
    font-family: verdana, sans-serif;
}
h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}
dockpanel td {
    border: 1px solid #BBBBBB;
    padding: 3px;
}

Following is the content of the modified HTML host file war/HelloWorld.html.

<html>
<head>
<title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript"
src="helloworld/helloworld.nocache.js">
    </script>
</head>
<body>
<h1>DockPanel Widget Demonstration</h1>

Let us have following content of Java file <code>src/com.tutorialspoint/HelloWorld.java</code> which will demonstrate use of DockPanel widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.clientEntryPoint;
import com.google.gwt.user.client.ui.DockPanel;
import com.google.gwt.user.client.ui.html;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.ScrollPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        DockPanel dockPanel = new DockPanel();
        dockPanel.setstyleName("dockpanel");
        dockPanel.setSpacing(4);
        dockPanel.setHorizontalAlignment(DockPanel.ALIGN_CENTER);

        // Add text all around
        dockPanel.add(new HTML("This is the first north component."),
                       DockPanel.NORTH);
        dockPanel.add(new HTML("This is the first south component."),
                       DockPanel.SOUTH);
        dockPanel.add(new HTML("This is the east component."),
                       DockPanel.EAST);
        dockPanel.add(new HTML("This is the west component."),
                       DockPanel.WEST);
    }
}
```
dockPanel.add(new HTML("This is the second north component."),
DockPanel.NORTH);
dockPanel.add(new HTML("This is the second south component"),
DockPanel.SOUTH);

// Add scrollable text in the center
HTML contents = new HTML("This is a ScrollPanel contained" +
" at the center of a DockPanel."
+" By putting some fairly large contents in the middle"
+" and setting its size explicitly, it becomes a scrollable area"
+" within the page, but without requiring the use of an IFrame." +
" Here's quite a bit more meaningless text that will serve
primarily"
+" to make this thing scroll off the bottom of its visible area."
+" Otherwise, you might have to make it really, really"
+" small in order to see the nifty scroll bars!");
ScrollPanel scroller = new ScrollPanel(contents);
scroller.setSize("400px", "100px");
dockPanel.add(scroller, DockPanel.CENTER);

VerticalPanel vPanel = new VerticalPanel();
vPanel.add(dockPanel);

// Add the widgets to the root panel.
RootPanel.get().add(vPanel);
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, this will produce the following result:
GWT - HTMLPanel Widget

**Introduction**

The HTMLPanel widget represents a panel that contains HTML, and which can attach child widgets to identified elements within that HTML.

**Class Declaration**

Following is the declaration for com.google.gwt.user.client.ui.HTMLPanel class:

```java
public class HTMLPanel
    extends ComplexPanel
```

**Class Constructors**

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>

<td></td>
<td>Finds an element within this panel by its id.</td>
</tr>
</tbody>
</table>

## Methods Inherited

This class inherits methods from the following classes:
- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Panel
- com.google.gwt.user.client.ui.ComplexPanel
- java.lang.Object

### Htmlpanel Widget Example

This example will take you through simple steps to show usage of a HTMLPanel Widget in GWT. Follow the following steps to update the GWT application we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <em>com.tutorialspoint</em> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml</em>, <em>HelloWorld.css</em>, <em>HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
    <!-- Inherit the core Web Toolkit stuff. -->
    <inherits name='com.google.gwt.user.User'/>

    <!-- Inherit the default GWT style sheet. -->
    <inherits name='com.google.gwt.user.theme.clean.Clean'/>

    <!-- Specify the app entry point class. -->
    <entry-point class='com.tutorialspoint.client.HelloWorld'/>```
<!-- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>

</module>

Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}
```

Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript"
    src="helloworld/helloworld.nocache.js">
    </script>
</head>
<body>

<h1>HTMLPanel Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```
Let us have following content of Java file(src/com.tutorialspoint/HelloWorld.java) which will demonstrate use of HTMLPanel widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.HTMLPanel;
import com.google.gwt.user.client.ui.RootPanel;

public class HelloWorld implements EntryPoint {
   public void onModuleLoad() {
       String htmlString = "This is a <b>HTMLPanel</b> containing" + " html contents. " + "<i>By putting some fairly large contents in the middle" + " and setting its size explicitly, it becomes a scrollable area" + " within the page, but without requiring the use of an IFRAME.</i>"
       + "<u>Here's quite a bit more meaningless text that will serve" + " to make this thing scroll off the bottom of its visible area." + " Otherwise, you might have to make it really, really" + " small in order to see the nifty scroll bars!</u>";

       HTMLPanel htmlPanel = new HTMLPanel(htmlString);

       DecoratorPanel panel = new DecoratorPanel();
       panel.add(htmlPanel);

       // Add the widgets to the root panel.
       RootPanel.get().add(panel);
   }
}
```

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, this will produce following result:
**GWT - TabPanel Widget**

**Introduction**

The TabPanel widget represents panel that represents a tabbed set of pages, each of which contains another widget. Its child widgets are shown as the user selects the various tabs associated with them. The tabs can contain arbitrary HTML.

**Class Declaration**

Following is the declaration for com.google.gwt.user.client.ui.TabPanel class:

```java
@Deprecated
public class TabPanel
    extends Composite
    implements TabListener, SourcesTabEvents,
```
### Class Constructors

| 28   | `protected void onEnsureDebugId(java.lang.String baseID)`  
      | Deprecated. Affected Elements: -bar = The tab bar. -bar-tab# = The element containing the content of the tab itself. -bar-tab-wraper# = The cell containing the tab at the index. -bottom = The panel beneath the tab bar. |
| 29   | `void onTabSelected(SourcesTabEvents sender, int tabIndex)`  
      | Deprecated. Use SelectionHandler.onSelection(com.google.gwt.event.logical.shared.SelectionEvent) instead |
| 30   | `boolean remove(int index)`  
      | Deprecated. Removes the widget at the specified index. |
| 31   | `boolean remove(Widget widget)`  
      | Deprecated. Removes the given widget, and its associated tab. |
| 32   | `void removeTabListener(TabListener listener)`  
      | Deprecated. Use the HandlerRegistration.removeHandler() method on the object returned by and add*Handler method instead |
| 33   | `void selectTab(int index)`  
      | Deprecated. Programmatically selects the specified tab and fires events. |
| 34   | `void selectTab(int index, boolean fireEvents)`  
      | Deprecated. Programmatically selects the specified tab. |
| 35   | `void setAnimationEnabled(boolean enable)`  
      | Deprecated. Enable or disable animations. |
Methods Inherited

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Composite
- java.lang.Object

TabPanel Widget Example

This example will take you through simple steps to show usage of a TabPanel Widget in GWT. The following steps will help to you update the GWT application which we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `<src/com.tutorialspoint/HelloWorld.gwt.xml>`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>
</module>
```
Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}
```

Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript"
        src="helloworld/helloworld.nocache.js">
    </script>
</head>
<body>

<h1>TabPanel Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
```
Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of TabPanel widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.HTMLPanel;
import com.google.gwt.user.client.ui.Label;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TabPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        //Create an empty tab panel
        TabPanel tabPanel = new TabPanel();

        //create contents for tabs of tabpanel
        Label label1 = new Label("This is contents of TAB 1");
        label1.setHeight("200");
        Label label2 = new Label("This is contents of TAB 2");
        label2.setHeight("200");
        Label label3 = new Label("This is contents of TAB 3");
        label3.setHeight("200");

        //create titles for tabs
        String tab1Title = "TAB 1";
        String tab2Title = "TAB 2";
        String tab3Title = "TAB 3";

        //create tabs
        tabPanel.add(label1, tab1Title);
    }
}
```
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

tabPanel.add(label2, tab2Title);
tabPanel.add(label3, tab3Title);

//select first tab
tabPanel.selectTab(0);

//set width if tabpanel
tabPanel.setWidth("400");

// Add the widgets to the root panel.
RootPanel.get().add(tabPanel);
}
GWT - Composite Widget

Introduction
The Composite widget is a type of widget that can wrap another widget, hiding the wrapped widget’s methods. When added to a panel, a composite behaves exactly as if the widget it wraps had been added. The composite is useful for creating a single widget out of an aggregate of multiple other widgets contained in a single panel.

Class Declaration
Following is the declaration for com.google.gwt.user.client.ui.Composite class:

```java
public abstract class Composite
    extends Widget
```

339
### Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Composite()</td>
</tr>
</tbody>
</table>

### Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>protected Widget getWidget()</td>
</tr>
<tr>
<td></td>
<td>Provides subclasses access to the topmost widget that defines this composite.</td>
</tr>
<tr>

  <entry-point class='com.tutorialspoint.client.HelloWorld'/>
</module>
```
Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
  text-align: center;
  font-family: verdana, sans-serif;
}

h1{
  font-size: 2em;
  font-weight: bold;
  color: #777777;
  margin: 40px 0px 70px;
  text-align: center;
}
```

Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
  <link rel="stylesheet" href="HelloWorld.css"/>
  <script language="javascript"
src="helloworld/helloworld.nocache.js">
  </script>
</head>
<body>
  <h1>Composite Widget Demonstration</h1>
  <div id="gwtContainer"></div>
</body>
```
Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of Composite widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.user.client.ui.CheckBox;
import com.google.gwt.user.client.ui.Composite;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TextBox;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    /**
     * A composite of a TextBox and a CheckBox that optionally enables it.
     */
    private static class OptionalTextBox extends Composite implements ClickHandler {

        private TextBox textBox = new TextBox();
        private CheckBox checkBox = new CheckBox();

        /**
         * Constructs an OptionalTextBox with the given caption on the check.
         * @param caption the caption to be displayed with the check box
         */
        public OptionalTextBox(String caption) {
```

343
// Place the check above the text box using a vertical panel.
VerticalPanel panel = new VerticalPanel();
// panel.setBorderWidth(1);
panel.setSpacing(10);
panel.add(checkBox);
panel.add(textBox);

textBox.setWidth("200");
// Set the check box's caption, and check it by default.
checkBox.setText(caption);
checkBox.setValue(true);
checkBox.addClickHandler(this);

DecoratorPanel decoratorPanel = new DecoratorPanel();

decoratorPanel.add(panel);
// All composites must call initWidget() in their constructors.
initWidget(decoratorPanel);
}

public void onClick(ClickEvent event) {
    if (event.getSource() == checkBox) {
        // When the check box is clicked,
        // update the text box's enabled state.
        textBox.setEnabled(checkBox.getValue());
    }
}

public void onModuleLoad() {
    // Create an optional text box and add it to the root panel.
    OptionalTextBox otb = new OptionalTextBox("Check this to enable me");
    RootPanel.get().add(otb);
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

GWT - SimplePanel Widget

Introduction
The SimplePanel widget represents a base class for panels that contain only one widget.

Class Declaration
Following is the declaration for com.google.gwt.user.client.ui.SimplePanel class:

```java
public class SimplePanel
    extends Panel
    implements HasOneWidget
```
### Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>SimplePanel()</td>
</tr>
<tr>
<td></td>
<td>Creates an empty panel that uses a DIV for its contents.</td>
</tr>
<tr>
<td>2</td>
<td>protected SimplePanel(Element elem)</td>
</tr>
<tr>
<td></td>
<td>Creates an empty panel that uses the specified browser element for its contents.</td>
</tr>
</tbody>
</table>

### Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>void add(Widget w)</td>
</tr>
<tr>
<td></td>
<td>Adds a widget to this panel.</td>
</tr>
<tr>
<td>2</td>
<td>protected Element getContainerElement()</td>
</tr>
<tr>
<td></td>
<td>Override this method to specify that an element other than the root element be the container for the panel's child widget.</td>
</tr>
<tr>
<td>3</td>
<td>Widget getWidget()</td>
</tr>
<tr>
<td></td>
<td>Gets the panel's child widget.</td>
</tr>
<tr>
<td>4</td>
<td>java.util.Iterator&lt;Widget&gt; iterator()</td>
</tr>
<tr>
<td></td>
<td>Gets an iterator for the contained widgets.</td>
</tr>
<tr>
<td>5</td>
<td>boolean remove(Widget w)</td>
</tr>
<tr>
<td></td>
<td>Removes a child widget.</td>
</tr>
<tr>
<td>6</td>
<td>void setWidget(IsWidget w)</td>
</tr>
<tr>

<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <code>HelloWorld</code> under a package <code>com.tutorialspoint</code> as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <code>HelloWorld.gwt.xml</code>, <code>HelloWorld.css</code>, <code>HelloWorld.html</code> and <code>HelloWorld.java</code> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
    <!-- Inherit the core Web Toolkit stuff. -->
    <inherits name='com.google.gwt.user.User'/>

    <!-- Inherit the default GWT style sheet. -->
    <inherits name='com.google.gwt.user.theme.clean.Clean'/>

    <!-- Specify the app entry point class. -->
    <entry-point class='com.tutorialspoint.client.HelloWorld'/>
</module>
```
<!- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

```html
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}
```

Following is the content of the modified HTML host file war/HelloWorld.html.

```html
<html>
<head>
    <title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript"
        src="helloworld/helloworld.nocache.js">
    </script>
</head>
<body>

<h1>SimplePanel Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
```
Let us have following content of Java file **src/com.tutorialspoint/HelloWorld.java** which will demonstrate use of SimplePanel widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.Label;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.SimplePanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        // Create a Simple Panel
        SimplePanel simplePanel = new SimplePanel();
        Label label = new Label("A Simple Label.");
        //add label to simple panel
        simplePanel.add(label);
        //set height and width of simple panel
        simplePanel.setHeight("200");
        simplePanel.setWidth("200");

        DecoratorPanel decoratorPanel = new DecoratorPanel();
        decoratorPanel.add(simplePanel);

        // Add the widgets to the root panel.
        RootPanel.get().add(decoratorPanel);
    }
}
```

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:
GWT - ScrollPanel Widget

Introduction
The ScrollPanel widget represents a simple panel that wraps its contents in a scrollable area.

Class Declaration
Following is the declaration for com.google.gwt.user.client.ui.ScrollPanel class:

<!-- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>
</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}

Following is the content of the modified HTML host file war/HelloWorld.html.

<html>
<head>
<title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript"
src="helloworld/helloworld.nocache.js">
    </script>
</head>
Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of ScrollPanel widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.HTML;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.ScrollPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        // Create scrollable text
        HTML contents = new HTML("This is a ScrollPanel."
                + " By putting some fairly large contents in the middle"
                + " and setting its size explicitly, it becomes a scrollable area"
                + " within the page, but without requiring the use of an IFRAME."
                + " Here’s quite a bit more meaningless text that will serve
primarily"
                + " to make this thing scroll off the bottom of its visible area."
                + " Otherwise, you might have to make it really, really"
                + " small in order to see the nifty scroll bars!");

        //create scrollpanel with content
        ScrollPanel scrollPanel = new ScrollPanel(contents);
        scrollPanel.setSize("400px", "100px");
    }
}
```
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

GWT - FocusPanel Widget

Introduction

The **FocusPanel** widget represents a simple panel that makes its contents focusable, and adds the ability to catch mouse and keyboard events.
Class Declaration

Following is the declaration for com.google.gwt.user.client.ui.FocusPanel class:

```java
public class FocusPanel
    extends SimplePanel
    implements HasFocus, SourcesClickEvents,
                SourcesMouseEvents, SourcesMouseWheelEvents,
                HasAllMouseHandlers, HasClickHandlers,
                HasDoubleClickHandlers, HasAllKeyHandlers,
                HasAllFocusHandlers
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>FocusPanel()</td>
</tr>
<tr>
<td></td>
<td>Creates an empty focus panel.</td>
</tr>
<tr>
<td>2</td>
<td>FocusPanel(Widget child)</td>
</tr>
<tr>
<td></td>
<td>Creates a new focus panel with the given child widget.</td>
</tr>
</tbody>
</table>

Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>HandlerRegistration addBlurHandler(BlurHandler handler)</td>
</tr>
<tr>
<td></td>
<td>Adds a BlurEvent handler.</td>

Deprecated. Use the HandlerRegistration.removeHandler() method on the object returned by addMouseWheelHandler(com.google.gwt.event.dom.client.MouseWheelHandler) instead

25 void setAccessKey(char key)
Sets the widget's 'access key'.

26 void setFocus(boolean focused)
Explicitly focus/unfocus this widget.

27 void setTabIndex(int index)
Sets the widget's position in the tab index.

Methods Inherited
This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Panel
- com.google.gwt.user.client.ui.SimplePanel
- java.lang.Object

FocusPanel Widget Example
This example will take you through simple steps to show usage of a FocusPanel Widget in GWT. Follow the following steps to update the GWT application we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Create a project with a name *HelloWorld* under a package *com.tutorialspoint* as explained in the GWT - Create Application chapter.

Modify *HelloWorld.gwt.xml*, *HelloWorld.css*, *HelloWorld.html* and *HelloWorld.java* as explained below. Keep rest of the files unchanged.

Compile and run the application to verify the result of the implemented logic.

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
 <!-- Inherit the core Web Toolkit stuff. -->
 <inherits name='com.google.gwt.user.User'/>

 <!-- Inherit the default GWT style sheet. -->
 <inherits name='com.google.gwt.user.theme.clean.Clean'/>

 <!-- Specify the app entry point class. -->
 <entry-point class='com.tutorialspoint.client.HelloWorld'/>

 <!-- Specify the paths for translatable code -->
 <source path='client'/>
 <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file *war/HelloWorld.css*.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}
```

```css
h1{
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
  <link rel="stylesheet" href="HelloWorld.css"/>
  <script language="javascript"
           src="helloworld/helloworld.nocache.js">
  </script>
</head>
<body>

<h1>FocusPanel Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of FocusPanel widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.FocusPanel;
import com.google.gwt.user.client.ui.HTML;
import com.google.gwt.user.client.ui.RootPanel;
```
public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        // Create text
        HTML contents = new HTML("This is a FocusPanel."
        + " Click on the panel and it will attain focus.");

        //create focus panel with content
        FocusPanel focusPanel = new FocusPanel(contents);
        focusPanel.setSize("400px", "100px");

        DecoratorPanel decoratorPanel = new DecoratorPanel();

        decoratorPanel.add(focusPanel);

        // Add the widgets to the root panel.
        RootPanel.get().add(decoratorPanel);
    }
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:
GWT - FormPanel Widget

Introduction
The **FormPanel** widget represents a panel that wraps its contents in an HTML `<FORM>` element.

Class Declaration
Following is the declaration for `com.google.gwt.user.client.ui.FormPanel` class:

```java
public class FormPanel
    extends SimplePanel
    implements FiresFormEvents,
            com.google.gwt.user.client.ui.impl.FormPanelImplHost
```

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
</table>

364
1. `FormPanel()`  
   Creates a new FormPanel.

2. `protected FormPanel(Element element)`  
   This constructor may be used by subclasses to explicitly use an existing element.

3. `protected FormPanel(Element element, boolean createIFrame)`  
   This constructor may be used by subclasses to explicitly use an existing element.

4. `FormPanel(NamedFrame frameTarget)`  
   Creates a FormPanel that targets a NamedFrame.

5. `FormPanel(java.lang.String target)`  
   Creates a new FormPanel.

### Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
</table>
| 1    | `void add Form Handler (FormHandler handler)`  
   Deprecated. Use `add Submit Complete Handler` (com.google.gwt.user.client.ui.FormPanel.SubmitCompleteHandler) and `add Submit Handler` (com.google.gwt.user.client.ui.FormPanel.SubmitHandler) instead |
| 2    | `Handler Registration addSubmit Complete Handler (FormPanel.SubmitCompleteHandler handler)`  
   Adds a FormPanel.Submit Complete Event handler. |
| 3    | `HandlerRegistration addSubmitHandler(FormPanel.SubmitHandler handler)`  
   Adds a FormPanel.Submit Event handler. |
<p>| 4    | <code>java.lang.String getAction()</code> |</p>
<table>

</tr>
<tr>
<td>16</td>
<td>void setMethod(java.lang.String method)</td>
<td>Sets the HTTP method used for submitting this form.</td>
</tr>
<tr>
<td>17</td>
<td>void submit()</td>
<td>Submits the form.</td>
</tr>
<tr>
<td>18</td>
<td>static FormPanel wrap(Element element)</td>
<td>Creates a FormPanel that wraps an existing &lt;form&gt; element.</td>
</tr>
<tr>
<td>19</td>
<td>static FormPanel wrap(Element element, boolean createIFrame)</td>
<td>Creates a FormPanel that wraps an existing &lt;form&gt; element.</td>
</tr>
</tbody>
</table>

**Methods Inherited**

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Panel
- com.google.gwt.user.client.ui.SimplePanel
- java.lang.Object

**FormPanel Widget Example**

This example will take you through simple steps to show usage of a FormPanel Widget in GWT. The following steps will help you update the GWT application which we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <em>com.tutorialspoint</em> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml</em>, <em>HelloWorld.css</em>, <em>HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented</td>
</tr>
</tbody>
</table>
Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file war/HelloWorld.css.

```css
body{
  text-align: center;
  font-family: verdana, sans-serif;
}

h1{
  font-size: 2em;
  font-weight: bold;
  color: #777777;
  margin: 40px 0px 70px;
  text-align: center;
}
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
  <head>
    <title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript"
       src="helloworld/helloworld.nocache.js">
    </script>
  </head>
  <body>
    <h1>FormPanel Widget Demonstration</h1>
    <div id="gwtContainer"></div>
  </body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of FormPanel widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.Button;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.FileUpload;
import com.google.gwt.user.client.ui.FormPanel;
import com.google.gwt.user.client.ui.FormPanel.SubmitCompleteEvent;
import com.google.gwt.user.client.ui.FormPanel.SubmitEvent;
import com.google.gwt.user.client.ui.ListBox;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TextBox;
```
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        // Create a FormPanel and point it at a service.
        final FormPanel form = new FormPanel();
        form.setAction("/myFormHandler");

        // Because we're going to add a FileUpload widget,
        // we'll need to set the form to use the POST method,
        // and multipart MIME encoding.
        form.setEncoding(FormPanel.ENCODING_MULTIPART);
        form.setMethod(FormPanel.METHOD_POST);

        // Create a panel to hold all of the form widgets.
        VerticalPanel panel = new VerticalPanel();
        panel.setSpacing(10);
        form.setWidget(panel);

        // Create a Textbox, giving it a name so that it will be
        // submitted.
        final TextBox tb = new TextBox();
        tb.setWidth("220");

        tb.setName("textBoxFormElement");
        panel.add(tb);

        // Create a ListBox, giving it a name and
        // some values to be associated with its options.
        ListBox lb = new ListBox();
        lb.setName("listBoxFormElement");
        lb.addItem("item1", "item1");
        lb.addItem("item2", "item2");
lb.addItem("item3", "item3");
lb.setWidth("220");
panel.add(lb);

// Create a FileUpload widget.
FileUpload upload = new FileUpload();
upload.setName("uploadFormElement");
panel.add(upload);

// Add a 'submit' button.
panel.add(new Button("Submit", new ClickHandler() {
    @Override
    public void onClick(ClickEvent event) {
        form.submit();
    }
}));

// Add an event handler to the form.
form.addSubmitHandler(new FormPanel.SubmitHandler() {
    @Override
    public void onSubmit(SubmitEvent event) {
        // This event is fired just before the form is submitted.
        // We can take this opportunity to perform validation.
        if (tb.getText().length() == 0) {
            Window.alert("The text box must not be empty");
            event.cancel();
        }
    }
});

form.addSubmitCompleteHandler(new FormPanel.SubmitCompleteHandler() {
    @Override
    public void onSubmitComplete(SubmitCompleteEvent event) {

    }
});
// When the form submission is successfully completed,
// this event is fired. Assuming the service returned
// a response of type text/html, we can get the result
// here.
Window.alert(event.getResults());
}
});

DecoratorPanel decoratorPanel = new DecoratorPanel();
decoratorPanel.add(form);
// Add the widgets to the root panel.
RootPanel.get().add(decoratorPanel);

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:
GWT - PopupPanel Widget

Introduction
The PopupPanel widget represents a panel that can pop up over other widgets. It overlays the browser's client area (and any previously-created popups).

Class Declaration
Following is the declaration for com.google.gwt.user.client.ui.PopupPanel class:

```java
public class PopupPanel
    extends SimplePanel
    implements SourcesPopupEvents, EventPreview,
                HasAnimation, HasCloseHandlers<PopupPanel>
```
### Class Constructors

<table>

    margin: 40px 0px 70px;
    text-align: center;
}

gwt-PopupPanel {
    border: 3px solid #000000;
    padding: 3px;
    background: white;
}

gwt-PopupPanelGlass {
    background-color: #000;
    opacity: 0.3;
    filter: alpha(opacity=30);
}
```
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>

<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript" src="helloworld/helloworld.nocache.js"></script>
</head>
<body>

<h1>PopupPanel Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of PopupPanel widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.Button;
```
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.HasHorizontalAlignment;
import com.google.gwt.user.client.ui.Label;
import com.google.gwt.user.client.ui.PopupPanel;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    private static class MyPopup extends PopupPanel {

        public MyPopup() {
            // PopupPanel's constructor takes 'auto-hide' as its boolean
            // parameter. If this is set, the panel closes itself
            // automatically when the user clicks outside of it.
            super(true);

            // PopupPanel is a SimplePanel, so you have to set it's widget
            // property to whatever you want its contents to be.
            setWidget(new Label("Click outside of this popup to close
            it"));
        }
    }

    public void onModuleLoad() {
        Button b1 = new Button("Click me to show popup");
        b1.addClickHandler(new ClickHandler() {
            public void onClick(ClickEvent event) {
                // Instantiate the popup and show it.
                new MyPopup().show();
            }
        });

        Button b2 = new Button("Click me to show popup partway"
b2.addClickHandler(new ClickHandler() {
    public void onClick(ClickEvent event) {
        // Create the new popup.
        final MyPopup popup = new MyPopup();
        // Position the popup 1/3rd of the way down and across
        // the screen, and show the popup. Since the position
        // calculation is based on the offsetWidth and offsetHeight
        // of the popup, you have to use the
        // setPopupPositionAndShow(callback) method. The
        // alternative
        // would be to call show(), calculate the left and
        // top positions, and call setPopupPosition(left, top).
        // This would have the ugly side effect of the popup
        // jumping
        // from its original position to its new position.
        popup.setPopupPositionAndShow(new PopupPanel.PositionCallback()
            public void setPosition(int offsetWidth, int
            offsetHeight) {
                int left = (Window.getClientWidth() - offsetWidth) / 3;
                int top = (Window.getClientHeight() - offsetHeight) / 3;
                popup.setPopupPosition(left, top);
            }
        });
    }
});
VerticalPanel panel = new VerticalPanel();
panel.setHorizontalAlignment(HasHorizontalAlignment.ALIGN_CENTER);
panel.setSpacing(10);
panel.add(b1);
panel.add(b2);
DecoratorPanel decoratorPanel = new DecoratorPanel();
decoratorPanel.add(panel);
// Add the widgets to the root panel.
RootPanel.get().add(decoratorPanel);
}
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

---

**GWT - DialogBox Widget**

**Introduction**

The **DialogBox** widget represents a form of popup that has a caption area at the top and can be dragged by the user. Unlike a PopupPanel, calls to PopupPanel.setWidth(String) and PopupPanel.setHeight(String) will set the width and height of the dialog box itself, even if a widget has not been added as yet.

**Class Declaration**

Following is the declaration for com.google.gwt.user.client.ui.DialogBox class:
public class DialogBox
    extends DecoratedPopupPanel
    implements HasHTML, HasSafeHtml, MouseListener

Class Constructors

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Constructor &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>DialogBox()</td>
</tr>
<tr>
<td></td>
<td>Creates an empty dialog box.</td>
</tr>
<tr>
<td>2</td>
<td>DialogBox(boolean autoHide)</td>
</tr>
<tr>
<td></td>
<td>Creates an empty dialog box, specifying its auto-hide property.</td>
</tr>
<tr>
<td>3</td>
<td>DialogBox(boolean autoHide, boolean modal)</td>
</tr>
<tr>
<td></td>
<td>Creates an empty dialog box, specifying its auto-hide and modal properties.</td>
</tr>
</tbody>
</table>

Class Methods

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Function name &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>protected void beginDragging(MouseDownEvent event)</td>
</tr>
<tr>
<td></td>
<td>Called on mouse down in the caption area, begins the dragging loop by turning on event capture.</td>
</tr>
<tr>
<td>2</td>
<td>protected void continueDragging(MouseMoveEvent event)</td>
</tr>
<tr>
<td></td>
<td>Called on mouse move in the caption area, continues dragging if it was started by beginDragging(com.google.gwt.event.dom.client.MouseDownEvent).</td>
</tr>
<tr>
<td>3</td>
<td>protected void doAttachChildren()</td>
</tr>
<tr>
<td></td>
<td>If a widget contains one or more child widgets that are not in the logical widget hierarchy (the child is physically connected only on the DOM level), it must override this method and call Widget.on Attach() for each of its child widgets.</td>

</tr>
</tbody>
</table>
| 14   | `void onMouseLeave(Widget sender)`  
Deprecated. Use Has Mouse Out Handlers.add Mouse Out Handler (com.google.gwt.event.dom.client.MouseEventHandler) instead |
| 15   | `void onMouseMove(Widget sender, int x, int y)`  
Deprecated. Use `continueDragging(com.google.gwt.event.dom.client.MouseEvent)` and `getCaption()` instead |
| 16   | `void onMouseUp(Widget sender, int x, int y)`  
Deprecated. Use `endDragging(com.google.gwt.event.dom.client.MouseEvent)` and `getCaption()` instead |
| 17   | `protected void onPreviewNativeEvent(Event.NativePreviewEvent event)` |
| 18   | `void setHTML(SafeHtml html)`  
Sets the html string inside the caption. |
| 19   | `void setHTML(java.lang.String html)`  
Sets the html string inside the caption. |
| 20   | `void setText(java.lang.String text)`  
Sets the text inside the caption. |
| 21   | `void show()`  
Shows the popup and attach it to the page. |

**Methods Inherited**

This class inherits methods from the following classes:

- com.google.gwt.user.client.ui.UIObject
- com.google.gwt.user.client.ui.Widget
- com.google.gwt.user.client.ui.Panel
- com.google.gwt.user.client.ui.SimplePanel
- com.google.gwt.user.client.ui.PopupPanel
- com.google.gwt.user.client.ui.DecoratedPopupPanel
- java.lang.Object
Dialogbox Widget Example

This example will take you through simple steps to show usage of a DialogBox Widget in GWT. The following steps will help to you update the GWT application which we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify HelloWorld.gwt.xml, HelloWorld.css, HelloWorld.html and HelloWorld.java as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
</module>
```
Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;

    background: url(images/corner.png) no-repeat -5px -15px;
    -background: url(images/corner_ie6.png) no-repeat -5px -15px;
}

html>body .gwt-DialogBox {
}

* html .gwt-DialogBox .dialogTopLeftInner {
    width: 5px;
    overflow: hidden;
}

* html .gwt-DialogBox .dialogTopRightInner {
    width: 8px;
    overflow: hidden;
}
Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
  <link rel="stylesheet" href="HelloWorld.css"/>
  <script language="javascript" src="helloworld/helloworld.nocache.js">
  </script>
</head>
<body>

<h1>DialogBox Widget Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of DialogBox widget.

```java
package com.tutorialspoint.client;
```
import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.Button;
import com.google.gwt.user.client.ui.DialogBox;
import com.google.gwt.user.client.ui.HasHorizontalAlignment;
import com.google.gwt.user.client.ui.Label;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    private static class MyDialog extends DialogBox {

        public MyDialog() {
            // Set the dialog box's caption.
            setText("My First Dialog");

            // Enable animation.
            setAnimationEnabled(true);

            // Enable glass background.
            setGlassEnabled(true);

            // DialogBox is a SimplePanel, so you have to set its widget
            // property to whatever you want its contents to be.
            Button ok = new Button("OK");
            ok.addClickHandler(new ClickHandler() {
                public void onClick(ClickEvent event) {
                    MyDialog.this.hide();
                }
            });
        }
    }
}
Label label = new Label("This is a simple dialog box.");

VerticalPanel panel = new VerticalPanel();
panel.setHeight("100");
panel.setWidth("300");
panel.setSpacing(10);
panel.setHorizontalAlignment(HasHorizontalAlignment.ALIGN_CENTER);
panel.add(label);
panel.add(ok);

setWidget(panel);
}
}

public void onModuleLoad() {
    Button b = new Button("Click me");
b.addClickHandler(new ClickHandler() {
        @Override
        public void onClick(ClickEvent event) {
            // Instantiate the dialog box and show it.
            MyDialog myDialog = new MyDialog();

            int left = Window.getClientWidth()/ 2;
            int top = Window.getClientHeight()/ 2;
            myDialog.setPopupPosition(left, top);
            myDialog.show();
        }
    });

    RootPanel.get().add(b);
}
}
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

![DialogBox Widget Demonstration](image)

DialogBox Widget Demonstration

Click me

My First Dialog

This is a simple dialog box.

OK
GWT provides a event handler model similar to Java AWT or SWING User Interface frameworks.

- A listener interface defines one or more methods that the widget calls to announce an event. GWT provides a list of interfaces corresponding to various possible events.
- A class wishing to receive events of a particular type implements the associated handler interface and then passes a reference to itself to the widget to subscribe to a set of events.

For example, the **Button** class publishes **click events** so that you will have to write a class to implement **ClickHandler** to handle a **click** event.

### Event Handler Interfaces

All GWT event handlers have been extended from **EventHandler** interface and each handler has only a single method with a single argument. This argument is always an object of associated event type. Each event object have a number of methods to manipulate the passed event object. For example for click event you will have to write your handler as follows:

```java
/**
 * create a custom click handler which will call
 * onClick method when button is clicked.
 */

public class MyClickHandler implements ClickHandler {
    @Override
    public void onClick(ClickEvent event) {
        Window.alert("Hello World!");
    }
}
```

Now any class wishing to receive click events will call **addClickHandler()** to register an event handler as follows:

```java
/**
 * create button and attach click handler
 */
```
Each widget supporting an event type will have a method of the form `HandlerRegistration addFooHandler(FooEvent)` where `Foo` is the actual event like Click, Error, KeyPress etc.

Following is the list of important GWT event handlers and associated events and handler registration methods:

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Event Interface</th>
<th>Event Method &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Before Selection Handler&lt;I&gt;</td>
<td>void on Before Selection (Before Selection Event&lt;I&gt; event); Called when BeforeSelectionEvent is fired.</td>
</tr>
<tr>
<td>2</td>
<td>BlurHandler</td>
<td>void on Blur(Blur Event event); Called when Blur Event is fired.</td>
</tr>
<tr>
<td>3</td>
<td>ChangeHandler</td>
<td>void onChange(ChangeEvent event); Called when a change event is fired.</td>
</tr>
<tr>
<td>4</td>
<td>ClickHandler</td>
<td>void onClick(ClickEvent event); Called when a native click event is fired.</td>
</tr>

</tr>
<tr>
<td>23</td>
<td>ScrollHandler</td>
<td>void onScroll(ScrollEvent event) ;</td>
</tr>
<tr>
<td>24</td>
<td>SelectionHandler&lt;I&gt;</td>
<td>void onSelection(SelectionEvent&lt;I&gt; event) ;</td>
</tr>
<tr>
<td>S.N.</td>
<td>Method &amp; Description</td>
<td></td>
</tr>
<tr>
<td>------</td>
<td>--------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>protected void dispatch(ClickHandler handler) This method should only be called by HandlerManager</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>DomEvent.Type &lt;FooHandler&gt; getAssociatedType() This method returns the type used to register Foo event.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>static DomEvent.Type&lt;FooHandler&gt; getType() This method gets the event type associated with Foo events.</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>public java.lang.Object getSource() This method returns the source that last fired this event.</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>protected final boolean isLive() This method returns whether the event is live.</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>protected void kill() This method kills the event</td>
<td></td>
</tr>
</tbody>
</table>

**Event Methods**

As mentioned earlier, each handler has a single method with a single argument which holds the event object, for example `void onClick(ClickEvent event)` or `void onKeyDown(KeyDownEvent event)`. The event objects like `ClickEvent` and `KeyDownEvent` have few common methods which are listed below:

<table>
<thead>
<tr>
<th>S.N.</th>
<th>Method &amp; Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>protected void dispatch(ClickHandler handler) This method should only be called by HandlerManager</td>
</tr>
<tr>
<td>2</td>
<td>DomEvent.Type &lt;FooHandler&gt; getAssociatedType() This method returns the type used to register Foo event.</td>
</tr>
<tr>
<td>3</td>
<td>static DomEvent.Type&lt;FooHandler&gt; getType() This method gets the event type associated with Foo events.</td>
</tr>
<tr>
<td>4</td>
<td>public java.lang.Object getSource() This method returns the source that last fired this event.</td>
</tr>
<tr>
<td>5</td>
<td>protected final boolean isLive() This method returns whether the event is live.</td>
</tr>
<tr>
<td>6</td>
<td>protected void kill() This method kills the event</td>
</tr>
</tbody>
</table>
**Example**

This example will take you through simple steps to show usage of a **Click** Event and **KeyDown** Event handling in GWT. Follow the following steps to update the GWT application, we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <code>com.tutorialspoint</code> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml</em>, <em>HelloWorld.css</em>, <em>HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
,module rename-to='helloworld'
   <!-- Inherit the core Web Toolkit stuff. -->
   <inherits name='com.google.gwt.user.User'/>

   <!-- Inherit the default GWT style sheet. -->
   <inherits name='com.google.gwt.user.theme.clean.Clean'/>

   <!-- Specify the app entry point class. -->
   <entry-point class='com.tutorialspoint.client.HelloWorld'/>

   <!-- Specify the paths for translatable code -->
   <source path='client'/>
   <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
   text-align: center;
}
```
Following is the content of the modified HTML host file **war/HelloWorld.html**.

```html
<html>
<head>
	<title>Hello World</title>
	<link rel="stylesheet" href="HelloWorld.css"/>
	<script language="javascript" src="helloworld/helloworld.nocache.js"></script>
</head>
<body>

<h1>Event Handling Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```

Let us have following content of Java file **src/com.tutorialspoint/HelloWorld.java** which will demonstrate use of Event Handling in GWT.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
```
public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        /**
         * create textbox and attach key down handler
         */
        TextBox textBox = new TextBox();
        textBox.addKeyDownHandler(new MyKeyDownHandler());

        /*
         * create button and attach click handler
         */
        Button button = new Button("Click Me!");
        button.addClickHandler(new MyClickHandler());

        VerticalPanel panel = new VerticalPanel();
        panel.setSpacing(10);
        panel.setHorizontalAlignment(HasHorizontalAlignment.ALIGN_CENTER);
        panel.setSize("300", "100");
        panel.add(textBox);
        panel.add(button);

        DecoratorPanel decoratorPanel = new DecoratorPanel();
decoratorPanel.add(panel);
RootPanel.get("gwtContainer").add(decoratorPanel);
}

/**
 * create a custom click handler which will call
 * onClick method when button is clicked.
 */
private class MyClickHandler implements ClickHandler {
  @Override
  public void onClick(ClickEvent event) {
    Window.alert("Hello World!");
  }
}

/**
 * create a custom key down handler which will call
 * onKeyDown method when a key is down in textbox.
 */
private class MyKeyDownHandler implements KeyDownHandler {
  @Override
  public void onKeyDown(KeyDownEvent event) {
    if(event.getNativeKeyCode() == KeyCodes.KEY_ENTER){
      Window.alert(((TextBox)event.getSource()).getValue());
    }
  }
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, this will produce following result:
Event Handling Demonstration

Hello World

Click Me!

Message from webpa...

Hello World!

OK
GWT provides three ways to create custom user interface elements. There are three general strategies to follow:

- **Create a widget by extending Composite Class:** This is the most common and easiest way to create custom widgets. Here you can use existing widgets to create composite view with custom properties.

- **Create a widget using GWT DOM API in JAVA:** GWT basic widgets are created in this way. Still it's a very complicated way to create custom widget and should be used cautiously.

- **Use JavaScript and wrap it in a widget using JSNI:** This should generally only be done as a last resort. Considering the cross-browser implications of the native methods, it becomes very complicated and also becomes more difficult to debug.

### Create Custom Widget with Composite Class

This example will take you through simple steps to show the creation of a Custom Widget in GWT. The following steps will help you update the GWT application, which we created in *GWT - Basic Widgets* chapter:

Here we are going to create a custom widget by extending Composite class, which is the easiest way to build custom widgets.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <code>HelloWorld</code> under a package <code>com.tutorialspoint</code> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <code>HelloWorld.gwt.xml</code>, <code>HelloWorld.css</code>, <code>HelloWorld.html</code> and <code>HelloWorld.java</code> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
```
<module rename-to='helloworld'>

<!-- Inherit the core Web Toolkit stuff. -->
<inherits name='com.google.gwt.user.User'/>

<!-- Inherit the default GWT style sheet. -->
<inherits name='com.google.gwt.user.theme.clean.Clean'/>

<!-- Specify the app entry point class. -->
<entry-point class='com.tutorialspoint.client.HelloWorld'/>

<!-- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>
</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

body{
  text-align: center;
  font-family: verdana, sans-serif;
}

h1{
  font-size: 2em;
  font-weight: bold;
  color: #777777;
  margin: 40px 0px 70px;
  text-align: center;
}

Following is the content of the modified HTML host file war/HelloWorld.html.

<html>
<head>
<title>Hello World</title>
  <link rel="stylesheet" href="HelloWorld.css"/>
</head>

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate creation of a Custom widget.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.user.client.ui.CheckBox;
import com.google.gwt.user.client.ui.Composite;
import com.google.gwt.user.client.ui.HorizontalPanel;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TextBox;

public class HelloWorld implements EntryPoint {

    /**
     * A composite of a TextBox and a CheckBox that optionally enables it.
     */
    private static class OptionalTextBox extends Composite implements ClickHandler {

        private TextBox textBox = new TextBox();
    }
```
private CheckBox checkBox = new CheckBox();
private boolean enabled = true;

public boolean isEnabled() {
    return enabled;
}

public void setEnabled(boolean enabled) {
    this.enabled = enabled;
}

/**
 * Style this widget using .optionalTextWidget CSS class.<br/>
 * Style textbox using .optionalTextBox CSS class.<br/>
 * Style checkbox using .optionalCheckBox CSS class.<br/>
 * Constructs an OptionalTextBox with the given caption
 * on the check.
 * @param caption the caption to be displayed with the check box
 */
public OptionalTextBox(String caption) {
    // place the check above the text box using a vertical panel.
    HorizontalPanel panel = new HorizontalPanel();
    // panel.setBorderWidth(1);
    panel.setSpacing(10);
    panel.add(checkBox);
    panel.add(textBox);

    // all composites must call initWidget() in their constructors.
    initWidget(panel);

    //set style name for entire widget
    setStyleName("optionalTextWidget");
//set style name for text box
textBox.setStyleName("optionalTextBox");

//set style name for check box
checkBox.setStyleName("optionalCheckBox");
textBox.setWidth("200");

// Set the check box's caption, and check it by default.
checkBox.setText(caption);
checkBox.setValue(enabled);
checkBox.addClickHandler(this);
enableTextBox(enabled,checkBox.getValue());

public void onClick(ClickEvent event) {
    if (event.getSource() == checkBox) {
        // When the check box is clicked,
        //update the text box's enabled state.
        enableTextBox(enabled,checkBox.getValue());
    }
}

private void enableTextBox(boolean enable,boolean isChecked){
    enable = (enable && isChecked) || (!enable && !isChecked);
textBox.setStyleDependentName("disabled", !enable);
textBox.setEnabled(enable);
}

public void onModuleLoad() {
    // Create an optional text box and add it to the root panel.
    OptionalTextBox otb = new OptionalTextBox(    
        "Want to explain the solution?");
    otb.setEnabled(true);
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:

![Custom Widget Demonstration](image)

You can notice following points

- Creation of Custom Widget by extending Composite widget is pretty easy.
- We've created a widget with GWT inbuilt widgets, TextBox and CheckBox thus using the concept of reusability.
- TextBox get disabled/enabled depending on state of checkbox. We've provided an API to enable/disable the control.
- We've exposed internal widgets styles via documented CSS styles.
Introduction

The UiBinder is a framework designed to separate Functionality and View of User Interface.

- The UiBinder framework allows developers to build GWT applications as HTML pages with GWT widgets configured throughout them.
- The UiBinder framework makes easier collaboration with UI designers who are more comfortable with XML, HTML and CSS than Java source code.
- The UiBinder provides a declarative way of defining User Interface.
- The UiBinder separates the programic logic from UI.
- The UiBinder is similar to what JSP is to Servlets.

UiBinder Workflow

Step 1: Create UI Declaration XML File

Create a XML/HTML based User Interface declaration file. We've created a Login.ui.xml file in our example.

```xml
<ui:UiBinder xmlns:ui='urn:ui:com.google.gwt.uibinder'
             xmlns:gwt='urn:import:com.google.gwt.user.client.ui'
             xmlns:res='urn:with:com.tutorialspoint.client.LoginResources'>
    <ui:with type="com.tutorialspoint.client.LoginResources" field="res"/>
    <gwt:HTMLPanel>...
    </gwt:HTMLPanel>
</ui:UiBinder>
```

Step 2: Use ui:field for Later Binding

Use ui:field attribute in XML/HTML element to relate UI field in XML with UI field in JAVA file for later binding.

```xml
<gwt:Label ui:field="completionLabel1" />
```
**Step 3: Create Java counterpart of UI XML**

Create Java based counterpart of XML based layout by extending Composite widget. We've created a `Login.java` file in our example.

```java
package com.tutorialspoint.client;
...
public class Login extends Composite {
...
}
```

**Step 4: Bind Java UI fields with UiField annotation**

use `@UiField` annotation in `Login.java` to designate counterpart class members to bind to XML-based fields in `Login.ui.xml`

```java
public class Login extends Composite {
...
@UiField
Label completionLabel1;

@UiField
Label completionLabel2;
...
}
```

**Step 5: Bind Java UI with UI XML with UiTemplate annotation**

Instruct GWT to bind java based component `Login.java` and XML based layout `Login.ui.xml` using `@UiTemplate` annotation

```java
public class Login extends Composite {

    private static LoginUiBinder uiBinder = GWT.create(LoginUiBinder.class);

    /*
```
* @UiTemplate is not mandatory but allows multiple XML templates
* to be used for the same widget.
* Default file loaded will be <class-name>.ui.xml
*/
@UiTemplate("Login.ui.xml")
interface LoginUiBinder extends UiBinder<Widget, Login> {
    
    ...
}

Step 6: Create CSS File

Create an external CSS file `Login.css` and Java based Resource `LoginResources.java` file equivalent to css styles

```css
 battlefield {
    font-family: Arial, Sans-serif;
    color: #000000;
    font-size: 11px;
    text-align: left;
}

Step 7: Create Java based Resource File for CSS File

package com.tutorialspoint.client;
...

public interface LoginResources extends ClientBundle {
    public interface MyCss extends CssResource {
        String blackText();

        ...
    }

    @Source("Login.css")
    MyCss style();
```
Step 8: Attach CSS resource in Java UI Code file.

Attach an external CSS file **Login.css** using Constructor of Java based widget class **Login.java**

```java
public Login() {
    this.res = GWT.create(LoginResources.class);
    res.style().ensureInjected();
    initWidget(uiBinder.createAndBindUi(this));
}
```

**UIBinder Complete Example**

This example will take you through simple steps to show usage of a UIBinder in GWT. Follow the following steps to update the GWT application we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <em>com.tutorialspoint</em> as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml</em>, <em>HelloWorld.css</em>, <em>HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor *src/com.tutorialspoint/HelloWorld.gwt.xml*.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
    <!-- Inherit the core Web Toolkit stuff. -->
    <inherits name='com.google.gwt.user.User'/>  
    <!-- Inherit the default GWT style sheet. -->
    <inherits name='com.google.gwt.user.theme.clean.Clean'/>  
    <!-- Inherit the UIBinder module. -->
    <inherits name='com.google.gwt.uibinder.UiBinder'/>  
</module>
```
Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}
```

Following is the content of the modified HTML host file `war/HelloWorld.html`.

```html
<html>
<head>
<title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript"
src="helloworld/helloworld.nocache.js">
    </script>
</head>
<body>

<h1>UiBinder Demonstration</h1>
<div id="gwtContainer"></div>
</body>
</html>
```
Now create a new UiBinder template and owner class (File -> New -> UiBinder).

Choose the client package for the project and then name it Login. Leave all of the other defaults.

Click Finish button and the plugin will create a new UiBinder template and owner class.
Now create Login.css file in the `src/com.tutorialspoint/client` package and place the following contents in it.

```css
.blackText {
    font-family: Arial, Sans-serif;
    color: #000000;
    font-size: 11px;
    text-align: left;
}

.redText {
    font-family: Arial, Sans-serif;
    color: #ff0000;
    font-size: 11px;
    text-align: left;
}
```
Now create LoginResources.java file in the src/com.tutorialspoint/client package and place the following contents in it

```java
package com.tutorialspoint.client;
```
import com.google.gwt.resources.client.ClientBundle;
import com.google.gwt.resources.client.CssResource;

public interface LoginResources extends ClientBundle {
    /**
     * Sample CssResource.
     */
    public interface MyCss extends CssResource {
        String blackText();
        String redText();
        String loginButton();
        String box();
        String background();
    }

    @Source("Login.css")
    MyCss style();
}

Replace the contents of Login.ui.xml in src/com.tutorialspoint/client package with the following:

```xml
<ui:UiBinder xmlns:ui='urn:ui:com.google.gwt.uibinder'
xmns:gwt='urn:import:com.google.gwt.user.client.ui'
xmns:res='urn:with:com.tutorialspoint.client.LoginResources'>
    <ui:with type="com.tutorialspoint.client.LoginResources" field="res">
    </ui:with>
    <gwt:HTMLPanel>
        <div align="center">
            <gwt:VerticalPanel res:styleName="style.background">
```
Replace the contents of Login.java in src/com.tutorialspoint/client package with the following:

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.GWT;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.logical.shared.ValueChangeEvent;
import com.google.gwt.uibinder.client.UiBinder;
import com.google.gwt.uibinder.client.UiField;
import com.google.gwt.uibinder.client.UiHandler;
import com.google.gwt.uibinder.client.UiTemplate;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.Composite;
import com.google.gwt.user.client.ui.Label;
```
import com.google.gwt.user.client.ui.TextBox;
import com.google.gwt.user.client.ui.Widget;

public class Login extends Composite {

    private static LoginUiBinder uiBinder = GWT.create(LoginUiBinder.class);

    /*
    * @UiTemplate is not mandatory but allows multiple XML templates
    * to be used for the same widget.
    * Default file loaded will be <class-name>.ui.xml
    */
    @UiTemplate("Login.ui.xml")
    interface LoginUiBinder extends UiBinder<Widget, Login> {
    }

    @UiField(provided = true)
    final LoginResources res;

    public Login() {
        this.res = GWT.create(LoginResources.class);
        res.style().ensureInjected();
        initWidget(uiBinder.createAndBindUi(this));
    }

    @UiField
    TextBox loginBox;

    @UiField
    TextBox passwordBox;

    @UiField
    Label completionLabel1;
@UiField
Label completionLabel2;

private Boolean tooShort = false;

/*
 * Method name is not relevant, the binding is done according to the
 * class
 * of the parameter.
 */
@UiHandler("buttonSubmit")
void doClickSubmit(ClickEvent event) {
    if (tooShort) {
        Window.alert("Login Successful!");
    } else {
        Window.alert("Login or Password is too short!");
    }
}

@UiHandler("loginBox")
void handleLoginChange(ValueChangeEvent<String> event) {
    if (event.getValue().length() < 6) {
        completionLabel1.setText("Login too short (Size must be > 6)"),
        tooShort = true;
    } else {
        tooShort = false;
        completionLabel1.setText("");
    }
}

@UiHandler("passwordBox")
void handlePasswordChange(ValueChangeEvent<String> event) {
    if (event.getValue().length() < 6) {

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` which will demonstrate use of UiBinder.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.user.client.ui.RootPanel;

public class HelloWorld implements EntryPoint {
    public void onModuleLoad() {
        RootPanel.get().add(new Login());
    }
}
```

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce following result:
A GWT based application generally consists of a client side module and server side module. Client side code runs in browser and server side code runs in web server. Client side code has to make an HTTP request accross the network to access server side data.

RPC, Remote procedure call is the mechanism used by GWT in which client code can directly execute the server side methods.

- GWT RPC is servlet based.
- GWT RPC is asynchronous and client is never blocked during communication.
- Using GWT RPC Java objects can be sent directly between the client and the server (which are automatically serialized by the GWT framework).
- Server-side servlet is termed as service.
- Remote procedure call that is calling methods of server side servlets from client side code is referred to as invoking a service.

**GWT RPC Components**

Following are the three components used in GWT RPC communication mechanism

- A remote service (server-side servlet) that runs on the server.
- Client code to invoke that service.
- Java data objects which will be passed between client and server.

GWT client and server both serialize and deserialize data automatically so developers are not required to serialize/deserialize objects and data objects can travel over HTTP.

Following diagram is showing the RPC Architecture.
To start using RPC, we’re required to follow the GWT conventions.

**RPC Communication Workflow**

**Step 1: Create a Serializable Model Class**

Define a java model object at client side which should be serializable.

```java
public class Message implements Serializable {
    ...
    private String message;
    public Message(){}

    public void setMessage(String message) {
        this.message = message;
    }
    ...
}
```
**Step 2: Create a Service Interface**

Define an interface for service on client side that extends RemoteService listing all service methods.

Use annotation @RemoteServiceRelativePath to map the service with a default path of remote servlet relative to the module base URL.

```java
@RemoteServiceRelativePath("message")
public interface MessageService extends RemoteService {
    Message getMessage(String input);
}
```

**Step 2: Create a Async Service Interface**

Define an asynchronous interface to service on client side (at same location as service mentioned above) which will be used in the GWT client code.

```java
public interface MessageServiceAsync {
    void getMessage(String input, AsyncCallback<Message> callback);
}
```

**Step 3: Create a Service Implementation Servlet class**

Implement the interface at server side and that class should extends RemoteServiceServlet class.

```java
public class MessageServiceImpl extends RemoteServiceServlet implements MessageService{
    ... public Message getMessage(String input) {
        String messageString = "Hello " + input + "!";
        Message message = new Message();
        message.setMessage(messageString);
        return message;
    }
}
```

**Step 4: Update Web.xml to include Servlet declaration**

Edit the web application deployment descriptor (web.xml) to include MessageServiceImpl Servlet declaration.
<web-app>
   ...
   <servlet>
      <servlet-name>messageServiceImpl</servlet-name>
      <servlet-class>com.tutorialspoint.server.MessageServiceImpl</servlet-class>
   </servlet>
   <servlet-mapping>
      <servlet-name>messageServiceImpl</servlet-name>
      <url-pattern>/helloworld/message</url-pattern>
   </servlet-mapping>
</web-app>

**Step 5: Make the remote procedure call in Application Code**

Create the service proxy class.

```java
MessageServiceAsync messageService = GWT.create(MessageService.class);
```

Create the AsyncCallback Handler to handle RPC callback in which server returns the Message back to client.

```java
class MessageCallBack implements AsyncCallback<Message> {

   @Override
   public void onFailure(Throwable caught) {
      Window.alert("Unable to obtain server response: "
                     + caught.getMessage());
   }

   @Override
   public void onSuccess(Message result) {
      Window.alert(result.getMessage());
   }
}
```

Call Remote service when user interacts with UI.

```java
public class HelloWorld implements EntryPoint {
```
...  
public void onModuleLoad() {  
...  
    buttonMessage.addClickHandler(new ClickHandler() {  
        @Override  
        public void onClick(ClickEvent event) {  
            messageService.getMessage(txtName.getValue(),  
                new MessageCallBack());  
        }  
    });  
...  
}

**RPC Communication Complete Example**

This example will take you through simple steps to show example of a RPC Communication in GWT. The following steps will help to you update the GWT application which we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <em>com.tutorialspoint</em> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml</em>, <em>HelloWorld.css</em>, <em>HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor *src/com.tutorialspoint/HelloWorld.gwt.xml*

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
    <!-- Inherit the core Web Toolkit stuff. -->
    <inherits name='com.google.gwt.user.User'/>

    <!-- Inherit the default GWT style sheet. -->
</module>
```
Following is the content of the modified Style Sheet file war/HelloWorld.css.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}
```

Following is the content of the modified HTML host file war/HelloWorld.html.

```html
<html>
<head>
<title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript" src="helloworld/helloworld.nocache.js">
    </script>
</head>
<body>
```
<h1>RPC Communication Demonstration</h1>

```html
<div id="gwtContainer"></div>
</body>
</html>
```

Now create Message.java file in the `src/com.tutorialspoint/client` package and place the following contents in it.

```java
package com.tutorialspoint.client;

import java.io.Serializable;

public class Message implements Serializable {

    private static final long serialVersionUID = 1L;
    private String message;
    public Message(){};

    public void setMessage(String message) {
        this.message = message;
    }

    public String getMessage() {
        return message;
    }
}
```

Now create MessageService.java file in the `src/com.tutorialspoint/client` package and place the following contents in it.

```java
package com.tutorialspoint.client;

import com.google.gwt.user.client.rpc.RemoteService;
import com.google.gwt.user.client.rpc.RemoteServiceRelativePath;
```
@RemoteServiceRelativePath("message")
public interface MessageService extends RemoteService {
    Message getMessage(String input);
}

Now create MessageServiceAsync.java file in the src/com.tutorialspoint/client package and place the following contents in it

```java
package com.tutorialspoint.client;

import com.google.gwt.user.client.rpc.AsyncCallback;

public interface MessageServiceAsync {
    void getMessage(String input, AsyncCallback<Message> callback);
}
```

Now create MessageServiceImpl.java file in the src/com.tutorialspoint/server package and place the following contents in it

```java
package com.tutorialspoint.server;

import com.google.gwt.user.server.rpc.RemoteServiceServlet;
import com.tutorialspoint.client.Message;
import com.tutorialspoint.client.MessageService;

public class MessageServiceImpl extends RemoteServiceServlet implements MessageService{
    private static final long serialVersionUID = 1L;

    public Message getMessage(String input) {
        String messageString = "Hello " + input + "!";
        Message message = new Message();
        message.setMessage(messageString);
        return message;
    }
}
```
Update the content of the modified web application deployment descriptor `war/WEB-INF/web.xml` to include MessageServiceImpl Servlet declaration.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE web-app
    PUBLIC "-//Sun Microsystems, Inc.//DTD Web Application 2.3//EN"
    "http://java.sun.com/dtd/web-app_2_3.dtd">

<web-app>
    <!-- Default page to serve -->
    <welcome-file-list>
        <welcome-file>HelloWorld.html</welcome-file>
    </welcome-file-list>
    <servlet>
        <servlet-name>messageServiceImpl</servlet-name>
        <servlet-class>com.tutorialspoint.server.MessageServiceImpl</servlet-class>
    </servlet>
    <servlet-mapping>
        <servlet-name>messageServiceImpl</servlet-name>
        <url-pattern>/helloworld/message</url-pattern>
    </servlet-mapping>
</web-app>
```

Replace the contents of HelloWorld.java in `src/com.tutorialspoint/client` package with the following:

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.core.client.GWT;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.event.dom.client.KeyCodes;
import com.google.gwt.event.dom.client.KeyUpEvent;
import com.google.gwt.event.dom.client.KeyUpHandler;
```
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.rpc.AsyncCallback;
import com.google.gwt.user.client.Button;
import com.google.gwt.user.client.DecoratorPanel;
import com.google.gwt.user.client.HasHorizontalAlignment;
import com.google.gwt.user.client.HorizontalPanel;
import com.google.gwt.user.client.Label;
import com.google.gwt.user.client.RootPanel;
import com.google.gwt.user.client.TextBox;
import com.google.gwt.user.client.VerticalPanel;

public class HelloWorld implements EntryPoint {

    private MessageServiceAsync messageService =
    GWT.create(MessageService.class);

    private class MessageCallBack implements AsyncCallback<Message> {
        @Override
        public void onFailure(Throwable caught) {
            /* server side error occurred */
            Window.alert("Unable to obtain server response: " + caught.getMessage());
        }
        @Override
        public void onSuccess(Message result) {
            /* server returned result, show user the message */
            Window.alert(result.getMessage());
        }
    }

    public void onModuleLoad() {
        /* create UI */
        final TextBox txtName = new TextBox();
        txtName.setWidth("200");
    }
}
txtName.addKeyUpHandler(new KeyUpHandler() {
    @Override
    public void onKeyUp(KeyUpEvent event) {
        if(event.getNativeKeyCode() == KeyCodes.KEY_ENTER){
            /* make remote call to server to get the message */
            messageService.getMessage(txtName.getValue(),
                              new MessageCallBack());
        }
    }
});

Label lblName = new Label("Enter your name: ");

Button buttonMessage = new Button("Click Me!");

buttonMessage.addClickHandler(new ClickHandler() {
    @Override
    public void onClick(ClickEvent event) {
        /* make remote call to server to get the message */
        messageService.getMessage(txtName.getValue(),
                              new MessageCallBack());
    }
});

HorizontalPanel hPanel = new HorizontalPanel();
hPanel.add(lblName);
hPanel.add(txtName);
hPanel.setCellWidth(lblName, "130");

VerticalPanel vPanel = new VerticalPanel();
vPanel.setSpacing(10);
vPanel.add(hPanel);
vPanel.add(buttonMessage);
vPanel.setCellHorizontalAlignment(buttonMessage, HasHorizontalAlignment.ALIGN_RIGHT);
DecoratorPanel panel = new DecoratorPanel();
panel.add(vPanel);

// Add widgets to the root panel.
RootPanel.get("gwtContainer").add(panel);
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce following result:
GWT provides excellent support for automated testing of client side code using JUnit testing framework. In this article we'll demonstrate GWT and JUNIT integration.

**Download Junit archive**

JUnit Official Site: [http://www.junit.org](http://www.junit.org)

Download Junit-4.10.jar

<table>
<thead>
<tr>
<th>OS</th>
<th>Archive name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>junit4.10.jar</td>
</tr>
<tr>
<td>Linux</td>
<td>junit4.10.jar</td>
</tr>
<tr>
<td>Mac</td>
<td>junit4.10.jar</td>
</tr>
</tbody>
</table>

Store the downloaded jar file to some location on your computer. We've stored it at `C:/ > JUNIT`

**Locate GWT installation folder**

<table>
<thead>
<tr>
<th>OS</th>
<th>GWT installation folder</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>C:\GWT\gwt-2.1.0</td>
</tr>
<tr>
<td>Linux</td>
<td>/usr/local/GWT/gwt-2.1.0</td>
</tr>
<tr>
<td>Mac</td>
<td>/Library/GWT/gwt-2.1.0</td>
</tr>
</tbody>
</table>

**GWTTestCase Class**

GWT provides **GWTTestCase** base class which provides JUnit integration. Running a compiled class which extends GWTTestCase under JUnit launches the HtmlUnit browser which serves to emulate your application behavior during test execution.

GWTTestCase is a derived class from JUnit's TestCase and it can be run using JUnit TestRunner.
Using webAppCreator

GWT provides a special command line tool webAppCreator which can generate a starter test case for us, plus ant targets and eclipse launch configs for testing in both development mode and production mode.

Open command prompt and go to C:\ > GWT_WORKSPACE > where you want to create a new project with test support. Run the following command

```
C:\GWT_WORKSPACE>C:\GWT\gwt-2.1.0\webAppCreator
    -out HelloWorld
    -junit C:\JUNIT\junit-4.10.jar
    com.tutorialspoint.HelloWorld
```

Noteworthy Points

- We are executing webAppCreator command line utility.
- HelloWorld is the name of the project to be created
- -junit option instructs webAppCreator to add junit support to project
- com.tutorialspoint.HelloWorld is the name of the module

Verify the output.

```
Created directory HelloWorld\src
Created directory HelloWorld\war
Created directory HelloWorld\war\WEB-INF
Created directory HelloWorld\war\WEB-INF\lib

Created file
```
Understanding the test class: HelloWorldTest.java

```java
package com.tutorialspoint.client;

import com.tutorialspoint.shared.FieldVerifier;
import com.google.gwt.core.client.GWT;
import com.google.gwt.junit.client.GWTTestCase;
import com.google.gwt.user.client.rpc.AsyncCallback;
import com.google.gwt.user.client.rpc.ServiceDefTarget;

/**
 * GWT JUnit tests must extend GWTTestCase.
 */
public class HelloWorldTest extends GWTTestCase {

    /**
     * must refer to a valid module that sources this class.
     */
    public String getModuleName() {
```
return "com.tutorialspoint.HelloWorldJUnit";
}

/**
 * tests the FieldVerifier.
 */
public void testFieldVerifier() {
    assertFalse(FieldVerifier.isValidName(null));
    assertFalse(FieldVerifier.isValidName(""));
    assertFalse(FieldVerifier.isValidName("a"));
    assertFalse(FieldVerifier.isValidName("ab"));
    assertFalse(FieldVerifier.isValidName("abc"));
    assertTrue(FieldVerifier.isValidName("abcd"));
}

/**
 * this test will send a request to the server using the greetServer
 * method in GreetingService and verify the response.
 */
public void testGreetingService() {
    /* create the service that we will test. */
    GreetingServiceAsync greetingService =
        GWT.create(GreetingService.class);
    ServiceDefTarget target = (ServiceDefTarget) greetingService;
    target.setServiceEntryPoint(GWT.getModuleBaseURL() + "helloworld/greet");
    
    /* since RPC calls are asynchronous, we will need to wait
     * for a response after this test method returns. This line
     * tells the test runner to wait up to 10 seconds
     * before timing out. */
    delayTestFinish(10000);
    
    /* send a request to the server. */
}
greetingService.greetServer("GWT User",
new AsyncCallback<String>() {
    public void onFailure(Throwable caught) {
        /* The request resulted in an unexpected error. */
        fail("Request failure: " + caught.getMessage());
    }

    public void onSuccess(String result) {
        /* verify that the response is correct. */
        assertTrue(result.startsWith("Hello, GWT User!")));

        /* now that we have received a response, we need to 
tell the test runner that the test is complete. 
You must call finishTest() after an asynchronous test finishes successfully, or the test will time out.*/
        finishTest();
    }
});

Noteworthy Points

<table>
<thead>
<tr>
<th>S.No</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>HelloWorldTest class was generated in the com.tutorialspoint.client package under the HelloWorld/test directory.</td>
</tr>
<tr>
<td>2</td>
<td>HelloWorldTest class will contain unit test cases for HelloWorld.</td>
</tr>
<tr>
<td>3</td>
<td>HelloWorldTest class extends the GWTTestCase class in the com.google.gwt.junit.client package.</td>
</tr>
<tr>
<td>4</td>
<td>HelloWorldTest class has an abstract method (getModuleName) that must return the name of the GWT module. For HelloWorld, this is com.tutorialspoint.HelloWorldJUnit.</td>
</tr>
</tbody>
</table>
HelloWorldTest class is generated with two sample test cases testFieldVerifier, testSimple. We've added testGreetingService.

These methods use one of the many assert* functions that it inherits from the JUnit Assert class, which is an ancestor of GWTTestCase.

The assertTrue(boolean) function asserts that the boolean argument passed in evaluates to true. If not, the test will fail when run in JUnit.

## GWT - JUnit Integration Complete Example

This example will take you through simple steps to show example of JUnit Integration in GWT.

The following steps will help to you update the GWT application which we created above:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Import the project with a name HelloWorld in eclipse using import existing project wizard (File &gt; Import &gt; General &gt; Existing Projects into workspace ).</td>
</tr>
<tr>
<td>2</td>
<td>Modify HelloWorld.gwt.xml, HelloWorld.css, HelloWorld.html and HelloWorld.java as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following will be the project structure in eclipse.
Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Inherit the UiBinder module. -->
  <inherits name="com.google.gwt.uibinder.UiBinder"/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file war/HelloWorld.css.

```css
body{
  text-align: center;
  font-family: verdana, sans-serif;
}

h1{
  font-size: 2em;
  font-weight: bold;
  color: #777777;
  margin: 40px 0px 70px;
  text-align: center;
}
```

Following is the content of the modified HTML host file war/HelloWorld.html.

...
GWT

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript"
src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>

<h1>JUnit Integration Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>

Replace the contents of HelloWorld.java in src/com.tutorialspoint/client package with the following

```
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.core.client.GWT;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.event.dom.client.KeyCodes;
import com.google.gwt.event.dom.client.KeyUpEvent;
import com.google.gwt.event.dom.client.KeyUpHandler;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.rpc.AsyncCallback;
import com.google.gwt.user.client.ui.Button;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.HasHorizontalAlignment;
import com.google.gwt.user.client.ui.HorizontalPanel;
import com.google.gwt.user.client.ui.Label;
```

```
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TextBox;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        /*create UI */
        final TextBox txtName = new TextBox();
        txtName.setWidth("200");
        txtName.addKeyUpHandler(new KeyUpHandler() {
            @Override
            public void onKeyUp(KeyUpEvent event) {
                if(event.getNativeKeyCode() == KeyCodes.KEY_ENTER){
                    Window.alert(getGreeting(txtName.getValue()));
                }
            }
        });
        Label lblName = new Label("Enter your name: ");
        Button buttonMessage = new Button("Click Me!");
        buttonMessage.addClickHandler(new ClickHandler() {
            @Override
            public void onClick(ClickEvent event) {
                Window.alert(getGreeting(txtName.getValue()));
            }
        });
        HorizontalPanel hPanel = new HorizontalPanel();
        hPanel.add(lblName);
        hPanel.add(txtName);
        hPanel.setCellWidth(lblName, "130");
        VerticalPanel vPanel = new VerticalPanel();

    }
}

vPanel.setSpacing(10);
vPanel.add(hPanel);
vPanel.add(buttonMessage);
vPanel.setCellHorizontalAlignment(buttonMessage, HasHorizontalAlignment.ALIGN_RIGHT);

DecoratorPanel panel = new DecoratorPanel();
panel.add(vPanel);

// Add widgets to the root panel.
RootPanel.get("gwtContainer").add(panel);
}

public String getGreeting(String name){
    return "Hello "+name+"!";
}
}

Replace the contents of HelloWorldTest.java in test/com.tutorialspoint/client package with the following

package com.tutorialspoint.client;

import com.tutorialspoint.shared.FieldVerifier;
import com.google.gwt.core.client.GWT;
import com.google.gwt.junit.client.GWTTestCase;
import com.google.gwt.user.client.rpc.AsyncCallback;
import com.google.gwt.user.client.rpc.ServiceDefTarget;

/**
 * GWT JUnit tests must extend GWTTestCase.
 */
public class HelloWorldTest extends GWTTestCase {

    /**
     */

* must refer to a valid module that sources this class.
*/

public String getModuleName() {
    return "com.tutorialspoint.HelloWorldJUnit";
}

/**
 * tests the FieldVerifier.
 */

public void testFieldVerifier() {
    assertFalse(FieldVerifier.isValidName(null));
    assertFalse(FieldVerifier.isValidName(""));
    assertFalse(FieldVerifier.isValidName("a"));
    assertFalse(FieldVerifier.isValidName("ab"));
    assertFalse(FieldVerifier.isValidName("abc"));
    assertTrue(FieldVerifier.isValidName("abcd"));
}

/**
 * this test will send a request to the server using the greetServer
 * method in GreetingService and verify the response.
 */

public void testGreetingService() {
    /* create the service that we will test. */
    GreetingServiceAsync greetingService =
    GWT.create(GreetingService.class);
    ServiceDefTarget target = (ServiceDefTarget) greetingService;
    target.setServiceEntryPoint(GWT.getModuleBaseURL() + "helloworld/greet");

    /* since RPC calls are asynchronous, we will need to wait
     * for a response after this test method returns. This line
     * tells the test runner to wait up to 10 seconds
     * before timing out. */
delayTestFinish(10000);

/* send a request to the server. */
greetingService.greetServer("GWT User",
   new AsyncCallback<String>() {
      public void onFailure(Throwable caught) {
         /* The request resulted in an unexpected error. */
         fail("Request failure: " + caught.getMessage());
      }

      public void onSuccess(String result) {
         /* verify that the response is correct. */
         assertTrue(result.startsWith("Hello, GWT User!")));

         /* now that we have received a response, we need to
         tell the test runner that the test is complete.
         You must call finishTest() after an asynchronous test
         finishes successfully, or the test will time out.*/
         finishTest();
      }
   });

   /**
   * tests the getGreeting method.
   */
   public void testGetGreeting() {
      HelloWorld helloWorld = new HelloWorld();
      String name = "Robert";
      String expectedGreeting = "Hello "+name+"!";
      assertEquals(expectedGreeting,helloWorld.getGreeting(name));
   }
}
Run test cases in Eclipse using generated launch configurations.

We’ll run unit tests in Eclipse using the launch configurations generated by webAppCreator for both development mode and production mode.

Run the JUnit test in development mode.

- From the Eclipse menu bar, select Run > Run Configurations...
- Under JUnit section, select HelloWorldTest-dev
- To save the changes to the Arguments, press Apply
- To run the test, press Run

If everything is fine with your application, this will produce following result:

![JUnit Test Result in Development Mode]

Run the JUnit test in production mode.

- From the Eclipse menu bar, select Run > Run Configurations...
- Under JUnit section, select HelloWorldTest-prod
- To save the changes to the Arguments, press Apply
- To run the test, press Run

If everything is fine with your application, this will produce following result:
GWT provides excellent capability of debugging client-side as well as server-side code.

During development mode, GWT Application is in Java code based and is not translated to JavaScript.

When an application is running in development mode, the Java Virtual Machine (JVM) is actually executing the application code as compiled Java bytecode, using GWT capability to connect to a browser window.

GWT uses browser-based plugin to connect to JVM.

So developers are free to use any Java based IDE to debug both client-side GWT Code as well as server-side code.

In this article, we'll demonstrate the usage of debugging GWT Client code using Eclipse. We'll do the following tasks:

- Set break points in the code and see them in BreakPoint Explorer.
- Step through the code line by line during debugging.
- View the values of variable.
- Inspect the values of all the variables.
- Inspect the value of an expression.
- Display the stack frame for suspended threads.

**Debugging Example**

This example will take you through simple steps to demonstrate debugging a GWT application. The following steps will help to you update the GWT application which we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <code>HelloWorld</code> under a package <code>com.tutorialspoint</code> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <code>HelloWorld.gwt.xml</code>, <code>HelloWorld.css</code>, <code>HelloWorld.html</code> and <code>HelloWorld.java</code> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`. 
<?xml version="1.0" encoding="UTF-8"?>

<module rename-to='helloworld'>
   <!-- Inherit the core Web Toolkit stuff. -->
   <inherits name='com.google.gwt.user.User'/>

   <!-- Inherit the default GWT style sheet. -->
   <inherits name='com.google.gwt.user.theme.clean.Clean'/>

   <!-- Specify the app entry point class. -->
   <entry-point class='com.tutorialspoint.client.HelloWorld'/>

   <!-- Specify the paths for translatable code -->
   <source path='client'/>
   <source path='shared'/>
</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}

.gwt-Label{
    font-size: 150%;
    font-weight: bold;
    color: red;
    padding: 5px;
Following is the content of the modified HTML host file `war/HelloWorld.html` to accommodate two buttons.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript"
src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>
<h1>Debugging Application Demonstration</h1>
<div id="gwtContainer"></div>
</body>
</html>
```

Let us have the following content of Java file `src/com.tutorialspoint/HelloWorld.java` using which we will demonstrate the debugging capability of GWT Code.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.event.dom.client.KeyCodes;
import com.google.gwt.event.dom.client.KeyUpEvent;
import com.google.gwt.event.dom.client.KeyUpHandler;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.Button;
import com.google.gwt.user.client.ui.DecoratorPanel;
```
import com.google.gwt.user.client.ui.HasHorizontalAlignment;
import com.google.gwt.user.client.ui.HorizontalPanel;
import com.google.gwt.user.client.ui.Label;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TextBox;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        /*create UI */
        final TextBox txtName = new TextBox();
        txtName.setWidth("200");
        txtName.addKeyUpHandler(new KeyUpHandler() {
            @Override
            public void onKeyUp(KeyUpEvent event) {
                if(event.getNativeKeyCode() == KeyCodes.KEY_ENTER){
                    Window.alert(getGreeting(txtName.getValue()));
                }
            }
        });
        Label lblName = new Label("Enter your name: ");
        Button buttonMessage = new Button("Click Me!");
        buttonMessage.addClickHandler(new ClickHandler() {
            @Override
            public void onClick(ClickEvent event) {
                Window.alert(getGreeting(txtName.getValue()));
            }
        });
        Label lblName = new Label("Enter your name: ");
        Button buttonMessage = new Button("Click Me!");
        buttonMessage.addClickHandler(new ClickHandler() {
            @Override
            public void onClick(ClickEvent event) {
                Window.alert(getGreeting(txtName.getValue()));
            }
        });
        HorizontalPanel hPanel = new HorizontalPanel();
        hPanel.add(lblName);
        hPanel.add(txtName);
    }
}
Step 1 - Place BreakPoints

Place a breakpoint on the first line of `onModuleLoad()` of HelloWorld.java
Step 2 - Debug Application

Now click on Debug application menu and select HelloWorld application to debug the application.
If everything is fine, you must see GWT Development Mode active in Eclipse containing a URL as shown below. Double click the URL to open the GWT application.

As soon as the Application launches, you will see the focus on Eclipse breakpoint as we've placed the breakpoint on the first line of entry point method.
You can see the stacktrace for suspended threads.
You can see the values for expressions.

You can see the list of breakpoints placed.
Now keep pressing F6 until you reach the last line of onModuleLoad() method. As reference for function keys, F6 inspects the code line by line, F5 steps inside further, and F8 will resume the application. Now you can see the list of values of all variables of onModuleLoad() method.
The GWT client code can be debugged in the same way as a Java Application. Place breakpoints at any line and play with the debugging capabilities of GWT.
GWT provides three ways to internationalize a GWT application. We'll demonstrate use of Static String Internationalization being most commonly used among projects.

<table>
<thead>
<tr>
<th>Technique</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Static String Internationalization</td>
<td>This technique is most prevalent and requires very little overhead at runtime; is a very efficient technique for translating both constant and parameterized strings; simplest to implement. Static string internationalization uses standard Java properties files to store translated strings and parameterized messages, and strongly-typed Java interfaces are created to retrieve their values.</td>
</tr>
<tr>
<td>Dynamic String Internationalization</td>
<td>This technique is very flexible but slower than static string internationalization. Host page contains the localized strings therefore, applications are not required to be recompiled when we add a new locale. If GWT application is to be integrated with an existing server-side localization system, then this technique is to be used.</td>
</tr>
<tr>
<td>Localizable Interface</td>
<td>This technique is the most powerful among the three techniques. Implementing Localizable allows us to create localized versions of custom types. It's an advanced internationalization technique.</td>
</tr>
</tbody>
</table>

**Workflow of Internationalizing a GWT Application**

**Step 1: Create properties files**

Create properties file containing the messages to be used in the application. We've created a `HelloWorldMessages.properties` file in our example.

```properties
enterName=Enter your name
clickMe=Click Me
applicationTitle=Application Internationalization Demonstration
greeting=Hello {0}
```
Create properties files containing the translated values specific to locale. We've created a **HelloWorldMessages_de.properties** file in our example. This file contains translations in german language. _de specifies the german locale and we're going to support german language in our application.

If you are creating properties file using Eclipse, then change the encoding of the file to UTF-8. Select the file and then right-click on it to open its properties window. Select text file encoding as **Other UTF-8**. Apply and save changes to the file.

```java
enterName=Geben Sie Ihren Namen
clickMe=Klick mich
applicationTitle=Anwendung Internationalisierung Demonstration
greeting=Hallo {0}
```

### Step 2: Add i18n module to Module Descriptor XML File

Update the module file **HelloWorld.gwt.xml** to include support for german locale

```xml
g<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  ...
  <extend-property name="locale" values="de" />
  ...
</module>
```

### Step 3: Create Interface equivalent to properties file

Create HelloWorldMessages.java interface by extending Messages interface of GWT to include support for internalization. It should contain same method names as keys in properties file. Place holder would be replaced with String argument.

```java
public interface HelloWorldMessages extends Messages {

  @DefaultMessage("Enter your name")
  String enterName();
}
```
Step 4: Use Message Interface in UI component.

Use the object of **HelloWorldMessages** in **HelloWorld** to get the messages.

```java
public class HelloWorld implements EntryPoint {

    /* create an object of HelloWorldMessages interface
       using GWT.create() method */
    private HelloWorldMessages messages =
        GWT.create(HelloWorldMessages.class);

    public void onModuleLoad() {
        ...
        Label titleLabel = new Label(messages.applicationTitle());
        //Add title to the application
        RootPanel.get("gwtAppTitle").add(titleLabel);
        ...
    }
}
```

**Internationalization - Complete Example**

This example demonstrates the Internationalization capability of a GWT application.

Follow the following steps to update the GWT application we created in *GWT - Create Application* chapter
Step | Description
--- | ---
1 | Create a project with a name *HelloWorld* under a package `com.tutorialspoint` as explained in the *GWT - Create Application* chapter.
2 | Modify *HelloWorld.gwt.xml*, *HelloWorld.css*, *HelloWorld.html* and *HelloWorld.java* as explained below. Keep rest of the files unchanged.
3 | Compile and run the application to verify the result of the implemented logic.

Following is the content of the modified module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>
  <extend-property name="locale" values="de" />

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>
```

Following is the content of the modified Style Sheet file `war/HelloWorld.css`.

```css
body{
  text-align: center;
  font-family: verdana, sans-serif;
}

h1{
  font-size: 2em;
}
```
Following is the content of the modified HTML host file war/HelloWorld.html.

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript"
src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>

<h1 id="gwtAppName"></h1>
<div id="gwtContainer"></div>

</body>
</html>
```

Now create HelloWorldMessages.properties file in the `src/com.tutorialspoint/client` package and place the following contents in it.

```properties
enterName=Enter your name
clickMe=Click Me
applicationTitle=Application Internationalization Demonstration
greeting=Hello {0}
```

Now create HelloWorldMessages_de.properties file in the `src/com.tutorialspoint/client` package and place the following contents in it.

```properties
enterName=Geben Sie Ihren Namen
clickMe=Klick mich
applicationTitle=Anwendung Internationalisierung Demonstration
```
Now create `HelloWorldMessages.java` class in the `src/com.tutorialspoint/client` package and place the following contents in it:

```java
package com.tutorialspoint.client;
import com.google.gwt.i18n.client.Messages;

public interface HelloWorldMessages extends Messages {
    @DefaultMessage("Enter your name")
    String enterName();
    @DefaultMessage("Click Me")
    String clickMe();

    @DefaultMessage("Application Internationalization Demonstration")
    String applicationTitle();

    @DefaultMessage("Hello {0}")
    String greeting(String name);
}
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` using which we will demonstrate Internationalization capability of GWT Code.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client EntryPoint;
import com.google.gwt.core.client.gwt;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.event.dom.client.KeyCodes;
import com.google.gwt.event.dom.client.KeyUpEvent;
import com.google.gwt.event.dom.client.KeyUpHandler;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.Button;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.HasHorizontalAlignment;
```
import com.google.gwt.user.client.ui.HorizontalPanel;
import com.google.gwt.user.client.ui.Label;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TextBox;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    /* create an object of HelloWorldMessages interface using GWT.create() method */
    private HelloWorldMessages messages = GWT.create(HelloWorldMessages.class);

    public void onModuleLoad() {
        /* create UI */
        final TextBox txtName = new TextBox();
        txtName.setWidth("200");
        txtName.addKeyUpHandler(new KeyUpHandler() {
            @Override
            public void onKeyUp(KeyUpEvent event) {
                if(event.getNativeKeyCode() == KeyCodes.KEY_ENTER){
                    Window.alert(getGreeting(txtName.getValue()));
                }
            }
        });
        Label lblName = new Label(messages.enterName() + ": ");

        Button buttonMessage = new Button(messages.clickMe() + "!");

        buttonMessage.addClickHandler(new ClickHandler() {
            @Override
            public void onClick(ClickEvent event) {
                Window.alert(getGreeting(txtName.getValue()));
            }
        });
    }
}

import com.google.gwt.user.client.ui.HorizontalPanel;
import com.google.gwt.user.client.ui.Label;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TextBox;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    /* create an object of HelloWorldMessages interface using GWT.create() method */
    private HelloWorldMessages messages = GWT.create(HelloWorldMessages.class);

    public void onModuleLoad() {
        /* create UI */
        final TextBox txtName = new TextBox();
        txtName.setWidth("200");
        txtName.addKeyUpHandler(new KeyUpHandler() {
            @Override
            public void onKeyUp(KeyUpEvent event) {
                if(event.getNativeKeyCode() == KeyCodes.KEY_ENTER){
                    Window.alert(getGreeting(txtName.getValue()));
                }
            }
        });
        Label lblName = new Label(messages.enterName() + ": ");

        Button buttonMessage = new Button(messages.clickMe() + "!");

        buttonMessage.addClickHandler(new ClickHandler() {
            @Override
            public void onClick(ClickEvent event) {
                Window.alert(getGreeting(txtName.getValue()));
            }
        });
    }
}
HorizontalPanel hPanel = new HorizontalPanel();
hPanel.add(lblName);
hPanel.add(txtName);

VerticalPanel vPanel = new VerticalPanel();
vPanel.setSpacing(10);
vPanel.add(hPanel);
vPanel.add(buttonMessage);
vPanel.setCellHorizontalAlignment(buttonMessage, HasHorizontalAlignment.ALIGN_RIGHT);

DecoratorPanel panel = new DecoratorPanel();
panel.add(vPanel);
Label titleLabel = new Label(messages.applicationTitle());
//Add title to the application
RootPanel.get("gwtAppTitle").add(titleLabel);
// Add widgets to the root panel.
RootPanel.get("gwtContainer").add(panel);
}

public String getGreeting(String name){
    return messages.greeting(name + "!");
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:
Now update the URL to contain the `locale=de`. Set URL:  
http://127.0.0.1:8888/HelloWorld.html?gwt.codesvr=127.0.0.1:9997&locale=de. If everything is fine with your application, then this will produce the following result:
Geben Sie Ihren Namen: Klick mich!
GWT applications are normally single page application running JavaScripts and do not contain a lot of pages thus browsers do not keep track of user interaction with Application. To use browser's history functionality, application should generate a unique URL fragment for each navigable page.

GWT provides **History Mechanism** to handle this situation.

GWT uses a term **token** which is simply a string that the application can parse to return to a particular state. Application will save this token in browser's history as URL fragment.

For example, a history token named "pageIndex1" would be added to a URL as follows:

```
http://www.tutorialspoint.com/HelloWorld.html#pageIndex0
```

**History Management Workflow**

**Step 1: Enable History support**

In order to use GWT History support, we must first embed following iframe into our host HTML page.

```
<iframe src="javascript:'" id="__gwt_historyFrame" style="width:0;height:0;border:0"></iframe>
```

**Step 2: Add token to History**

Following example stats how to add token to browser history

```
int index = 0;
History.newItem("pageIndex" + index);
```

**Step 3: Retrieve token from History**

When user uses back/forward button of browser, we'll retrieve the token and update our application state accordingly.

```
History.addValueChangeHandler(new ValueChangeHandler<String>() {
```

474
@Override
public void onValueChange(ValueChangeEvent<String> event) {
    String historyToken = event.getValue();
    /* parse the history token */
    try {
        if (historyToken.substring(0, 9).equals("pageIndex")) {
            String tabIndexToken = historyToken.substring(9, 10);
            int tabIndex = Integer.parseInt(tabIndexToken);
            /* select the specified tab panel */
            tabPanel.selectTab(tabIndex);
        } else {
            tabPanel.selectTab(0);
        }
    } catch (IndexOutOfBoundsException e) {
        tabPanel.selectTab(0);
    }
}
}

Now let's see the History Class in Action.

**History Class - Complete Example**

This example will take you through simple steps to demonstrate History Management of a GWT application. Follow the following steps to update the GWT application we created in *GWT - Create Application* chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <em>com.tutorialspoint</em> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml</em>, <em>HelloWorld.css</em>, <em>HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

```
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}
```

Following is the content of the modified HTML host file war/HelloWorld.html

```html
<html>
<head>
<title>Hello World</title>
  <link rel="stylesheet" href="HelloWorld.css"/>
</head>
```
Let us have following content of Java file src/com.tutorialspoint/HelloWorld.java using which we will demonstrate History Management in GWT Code.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.logical.shared.SelectionEvent;
import com.google.gwt.event.logical.shared.SelectionHandler;
import com.google.gwt.event.logical.shared.ValueChangeEvent;
import com.google.gwt.event.logical.shared.ValueChangeHandler;
import com.google.gwt.user.client.History;
import com.google.gwt.user.client.ui.HTML;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TabPanel;

public class HelloWorld implements EntryPoint {

    /**
     * This is the entry point method.
     */
```
public void onModuleLoad() {
    /* create a tab panel to carry multiple pages */
    final TabPanel tabPanel = new TabPanel();

    /* create pages */
    HTML firstPage = new HTML("<h1>We are on first Page.</h1>");
    HTML secondPage = new HTML("<h1>We are on second Page.</h1>");
    HTML thirdPage = new HTML("<h1>We are on third Page.</h1>");

    String firstPageTitle = "First Page";
    String secondPageTitle = "Second Page";
    String thirdPageTitle = "Third Page";
    tabPanel.setWidth("400");

    /* add pages to tabPanel*/
    tabPanel.add(firstPage, firstPageTitle);
    tabPanel.add(secondPage, secondPageTitle);
    tabPanel.add(thirdPage, thirdPageTitle);

    /* add tab selection handler */
    tabPanel.addSelectionHandler(new SelectionHandler<Integer>() {
        @Override
        public void onSelection(SelectionEvent<Integer> event) {
            /* add a token to history containing pageIndex
                History class will change the URL of application
                by appending the token to it.
            */
            History.newItem("pageIndex" + event.getSelectedItem());
        }
    });

    /* add value change handler to History
        this method will be called, when browser's
Back button or Forward button are clicked and URL of application changes.

*/

History.addValueChangeHandler(new ValueChangeHandler<String>() {
    @Override
    public void onValueChange(ValueChangeEvent<String> event) {
        String historyToken = event.getValue();
        /* parse the history token */
        try {
            if (historyToken.substring(0, 9).equals("pageIndex")) {
                String tabIndexToken = historyToken.substring(9, 10);
                int tabIndex = Integer.parseInt(tabIndexToken);
                /* select the specified tab panel */
                tabPanel.selectTab(tabIndex);
            } else {
                tabPanel.selectTab(0);
            }
        } catch (IndexOutOfBoundsException e) {
            tabPanel.selectTab(0);
        }
    }
});

/* select the first tab by default */
tabPanel.selectTab(0);

/* add controls to RootPanel */
RootPanel.get().add(tabPanel);

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:
- Now click on each tab to select different pages.
- You should notice that, when each tab is selected, application url is changed and #pageIndex is added to the url.
- You can also see that browser's back and forward buttons are enabled now.
- Use back and forward button of the browser and you will see the different tabs get selected accordingly.
GWT supports browser history management using a History class for which you can reference GWT - History Class chapter.

GWT uses a term token which is simply a string that the application can parse to return to a particular state. Application will save this token in browser's history as URL fragment.

In GWT - History Class chapter, we handle the token creation and setting in the history by writing code.

In this article, we will discuss a special widget Hyperlink which does the token creation and history management for us automatically and gives application capability of bookmarking.

**Bookmarking Example**

This example will take you through some simple steps to demonstrate bookmarking of a GWT application.

The following steps will help to you update the GWT application which we created in GWT - Create Application chapter:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name HelloWorld under a package com.tutorialspoint as explained in the GWT - Create Application chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify HelloWorld.gwt.xml, HelloWorld.css, HelloWorld.html and HelloWorld.java as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor src/com.tutorialspoint/HelloWorld.gwt.xml.
<?xml version="1.0" encoding="UTF-8"?>

<module rename-to='helloworld'>

<!-- Inherit the core Web Toolkit stuff. -->
<inherits name='com.google.gwt.user.User'/>

<!-- Inherit the default GWT style sheet. -->
<inherits name='com.google.gwt.user.theme.clean.Clean'/>

<!-- Specify the app entry point class. -->
<entry-point class='com.tutorialspoint.client.HelloWorld'/>

<!-- Specify the paths for translatable code -->
<source path='client'/>
<source path='shared'/>

</module>

Following is the content of the modified Style Sheet file war/HelloWorld.css.

body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}

Following is the content of the modified HTML host file war/HelloWorld.html

<html>
<head>
Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` using which we will demonstrate Bookmarking in GWT Code.

```java
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.logical.shared.ValueChangeEvent;
import com.google.gwt.event.logical.shared.ValueChangeHandler;
import com.google.gwt.user.client.History;
import com.google.gwt.user.client.ui.HTML;
import com.google.gwt.user.client.ui.HorizontalPanel;
import com.google.gwt.user.client.ui.Hyperlink;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TabPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

```

```
private TabPanel tabPanel;

private void selectTab(String historyToken){
    /* parse the history token */
    try {
        if (historyToken.substring(0, 9).equals("pageIndex")) {
            String tabIndexToken = historyToken.substring(9, 10);
            int tabIndex = Integer.parseInt(tabIndexToken);
            /* Select the specified tab panel */
            tabPanel.selectTab(tabIndex);
        } else {
            tabPanel.selectTab(0);
        }
    } catch (IndexOutOfBoundsException e) {
        tabPanel.selectTab(0);
    }
}

/**
* This is the entry point method.
*/
public void onModuleLoad() {
    /* create a tab panel to carry multiple pages */
    tabPanel = new TabPanel();

    /* create pages */
    HTML firstPage = new HTML("<h1>We are on first Page.</h1>");
    HTML secondPage = new HTML("<h1>We are on second Page.</h1>");
    HTML thirdPage = new HTML("<h1>We are on third Page.</h1>");

    String firstPageTitle = "First Page";
    String secondPageTitle = "Second Page";
    String thirdPageTitle = "Third Page";
Hyperlink firstPageLink = new Hyperlink("1", "pageIndex0");
Hyperlink secondPageLink = new Hyperlink("2", "pageIndex1");
Hyperlink thirdPageLink = new Hyperlink("3", "pageIndex2");

HorizontalPanel linksHPanel = new HorizontalPanel();
linksHPanel.setSpacing(10);
linksHPanel.add(firstPageLink);
linksHPanel.add(secondPageLink);
linksHPanel.add(thirdPageLink);

/* If the application starts with no history token, 
   redirect to a pageIndex0 */
String initToken = History.getToken();

if (initToken.length() == 0) {
    History.newItem("pageIndex0");
    initToken = "pageIndex0";
}

tabPanel.setWidth("400");
/* add pages to tabPanel*/
tabPanel.add(firstPage, firstPageTitle);
tabPanel.add(secondPage, secondPageTitle);
tabPanel.add(thirdPage, thirdPageTitle);

/* add value change handler to History 
 * this method will be called, when browser's Back button 
 * or Forward button are clicked. 
 * and URL of application changes. 
 * */
History.addValueChangeHandler(new ValueChangeHandler<String>() {
    @Override
    public void onValueChange(ValueChangeEvent<String> event) {
        selectTab(event.getValue());
    }
});
Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, then this will produce the following result:
Now click on 1, 2 or 3. You can notice that the tab changes with indexes.

You should notice, when you click on 1, 2 or 3, application url is changed and #pageIndex is added to the url.

You can also see that browser's back and forward buttons are enabled now.

Use back and forward button of the browser and you will see the different tabs get selected accordingly.

Right Click on 1, 2 or 3. You can see options like open, open in new window, open in new tab, add to favourites etc.

Right Click on 3. Choose add to favourites. Save bookmark as page 3.

Open favorites and choose page 3. You will see the third tab selected.
The logging framework emulates java.util.logging, so it uses the same syntax and has the same behavior as server side logging code.

GWT logging is configured using .gwt.xml files.

We can configure logging to be enabled/disabled; we can enable/disable particular handlers, and change the default logging level.

**Types of Logger**

Loggers are organized in a tree structure, with the Root Logger at the root of the tree.

Name of the logger determine the Parent/Child relationships using . to separate sections of the name.

As an example if we have two loggers Hospital.room1 and Hospital.room2, then they are siblings, with their parent being the logger named Hospital. The Hospital logger (and any logger with a name which does not contain a dot ".") has the Root Logger as a parent.

```java
private static Logger room1Logger = Logger.getLogger("Hospital.room1");
private static Logger room2Logger = Logger.getLogger("Hospital.room2");
private static Logger hospitalLogger = Logger.getLogger("Hospital");
private static Logger rootLogger = Logger.getLogger("");
```

**Log Handlers**

GWT provides default handlers which will show the log entries made using loggers.

<table>
<thead>
<tr>
<th>Handler</th>
<th>Logs to</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SystemLogHandler</td>
<td>stdout</td>
<td>These messages can only be seen in Development Mode in the DevMode window.</td>
</tr>
<tr>
<td>DevelopmentModeLogHandler</td>
<td>DevMode Window</td>
<td>Logs by calling method GWT.log. These messages can only be seen in Development Mode in the DevMode window.</td>
</tr>
<tr>
<td>ConsoleLogHandler</td>
<td>javascript</td>
<td>Logs to the javascript console,</td>
</tr>
<tr>
<td>Logging Handler</td>
<td>Source</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FirebugLogHandler</td>
<td>Firebug</td>
<td>Logs to the firebug console.</td>
</tr>
<tr>
<td>PopupLogHandler</td>
<td>popup</td>
<td>Logs to the popup which resides in the upper left hand corner of application when this handler is enabled.</td>
</tr>
<tr>
<td>SimpleRemoteLogHandler</td>
<td>server</td>
<td>This handler sends log messages to the server, where they will be logged using the server side logging mechanism.</td>
</tr>
</tbody>
</table>

**Configure Logging in GWT Application**

HelloWorld.gwt.xml file is to be configured to enable GWT logging as follows:

```
# add logging module
<inherits name="com.google.gwt.logging.Logging"/>

# To change the default logLevel
<set-property name="gwt.logging.logLevel" value="SEVERE"/>

# To enable logging
<set-property name="gwt.logging.enabled" value="TRUE"/>

# To disable a popup Handler
<set-property name="gwt.logging.popupHandler" value="DISABLED"/>
```

**Use logger to log user actions**

```
/* Create Root Logger */
private static Logger rootLogger = Logger.getLogger("");

... rootLogger.log(Level.SEVERE, "pageIndex selected: " + event.getValue());
```

**Logging Framework Example**

This example will take you through simple steps to demonstrate Logging Capability of a GWT application. Follow the following steps to update the GWT application we created in GWT - Create Application chapter:
<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a project with a name <em>HelloWorld</em> under a package <em>com.tutorialspoint</em> as explained in the <em>GWT - Create Application</em> chapter.</td>
</tr>
<tr>
<td>2</td>
<td>Modify <em>HelloWorld.gwt.xml</em>, <em>HelloWorld.css</em>, <em>HelloWorld.html</em> and <em>HelloWorld.java</em> as explained below. Keep rest of the files unchanged.</td>
</tr>
<tr>
<td>3</td>
<td>Compile and run the application to verify the result of the implemented logic.</td>
</tr>
</tbody>
</table>

Following is the content of the modified module descriptor *src/com.tutorialspoint/HelloWorld.gwt.xml*.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
    <!-- Inherit the core Web Toolkit stuff. -->
    <inherits name='com.google.gwt.user.User'/>
    
    <!-- Inherit the default GWT style sheet. -->
    <inherits name='com.google.gwt.user.theme.clean.Clean'/>
    <inherits name='com.google.gwt.logging.Logging'/>

    <!-- Specify the app entry point class. -->
    <entry-point class='com.tutorialspoint.client.HelloWorld'/>

    <!-- Specify the paths for translatable code -->
    <source path='client'/>
    <source path='shared'/>
    <set-property name="gwt.logging.logLevel" value="SEVERE"/>
    <set-property name="gwt.logging.enabled" value="TRUE"/>
    <set-property name="gwt.logging.popupHandler" value="DISABLED" />
</module>
```

Following is the content of the modified Style Sheet file *war/HelloWorld.css*.

```css
body{
    text-align: center;
    font-family: verdana, sans-serif;
}

h1{
```
Following is the content of the modified HTML host file `war/HelloWorld.html`:

```html
<html>
<head>
<title>Hello World</title>
<link rel="stylesheet" href="HelloWorld.css"/>
<script language="javascript"
src="helloworld/helloworld.nocache.js">
</script>
</head>
<body>

<iframe src="javascript:''"
    id="__gwt_historyFrame"
    style="width:0;height:0;border:0"></iframe>

<h1> Logging Demonstration</h1>
<div id="gwtContainer"></div>

</body>
</html>
```

Let us have following content of Java file `src/com.tutorialspoint/HelloWorld.java` using which we will demonstrate Bookmarking in GWT Code.

```java
package com.tutorialspoint.client;

import java.util.logging.Level;
import java.util.logging.Logger;
```
import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.logical.shared.ValueChangeEvent;
import com.google.gwt.event.logical.shared.ValueChangeHandler;
import com.google.gwt.logging.client.HasWidgetsLogHandler;
import com.google.gwt.user.client.History;
import com.google.gwt.user.client.ui.HTML;
import com.google.gwt.user.client.ui.HorizontalPanel;
import com.google.gwt.user.client.ui.Hyperlink;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TabPanel;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    private TabPanel tabPanel;
    /* Create Root Logger */
    private static Logger rootLogger = Logger.getLogger("");
    private VerticalPanel customLogArea;

    private void selectTab(String historyToken){
        /* parse the history token */
        try {
            if (historyToken.substring(0, 9).equals("pageIndex")) {
                String tabIndexToken = historyToken.substring(9, 10);
                int tabIndex = Integer.parseInt(tabIndexToken);
                /* Select the specified tab panel */
                tabPanel.selectTab(tabIndex);
            } else {
                tabPanel.selectTab(0);
            }
        } catch (IndexOutOfBoundsException e) {
            tabPanel.selectTab(0);
        }
    }
}
/**
 * This is the entry point method.
 */

public void onModuleLoad() {
    /* create a tab panel to carry multiple pages */
    tabPanel = new TabPanel();

    /* create pages */
    HTML firstPage = new HTML("<h1>We are on first Page.</h1>");
    HTML secondPage = new HTML("<h1>We are on second Page.</h1>");
    HTML thirdPage = new HTML("<h1>We are on third Page.</h1>");

    String firstPageTitle = "First Page";
    String secondPageTitle = "Second Page";
    String thirdPageTitle = "Third Page";

    Hyperlink firstPageLink = new Hyperlink("1", "pageIndex0");
    Hyperlink secondPageLink = new Hyperlink("2", "pageIndex1");
    Hyperlink thirdPageLink = new Hyperlink("3", "pageIndex2");

    HorizontalPanel linksHPanel = new HorizontalPanel();
    linksHPanel.setSpacing(10);
    linksHPanel.add(firstPageLink);
    linksHPanel.add(secondPageLink);
    linksHPanel.add(thirdPageLink);

    /* If the application starts with no history token,
     * redirect to a pageIndex0 */
    String initToken = History.getToken();

    if (initToken.length() == 0) {
        History newItem("pageIndex0");
        initToken = "pageIndex0";
tabPanel.setWidth("400");

/* add pages to tabPanel*/
tabPanel.add(firstPage, firstPageTitle);
tabPanel.add(secondPage, secondPageTitle);
tabPanel.add(thirdPage, thirdPageTitle);

/* add value change handler to History */
* this method will be called, when browser's Back button
* or Forward button are clicked.
* and URL of application changes.
* */
History.addValueChangeHandler(new ValueChangeHandler<String>() {
    @Override
    public void onValueChange(ValueChangeEvent<String> event) {
        selectTab(event.getValue());
        rootLogger.log(Level.SEVERE, "pageIndex selected: " + event.getValue());
    }
});

selectTab(initToken);

VerticalPanel vPanel = new VerticalPanel();

vPanel.setSpacing(10);
vPanel.add(tabPanel);
vPanel.add(linksHPanel);

customLogArea = new VerticalPanel();
vPanel.add(customLogArea);

/* an example of using own custom logging area. */
rootLogger.addHandler(new HasWidgetsLogHandler(customLogArea));

/* add controls to RootPanel */
RootPanel.get().add(vPanel);
}
}

Once you are ready with all the changes done, let us compile and run the application in development mode as we did in GWT - Create Application chapter. If everything is fine with your application, this will produce following result:
Now click on 1, 2 or 3. You can notice, when you click on 1, 2 or 3 you can see the log is getting printed displaying the pageIndex. Check the Console output in Eclipse. You can see the log is getting printed in Eclipse console as well.

Fri Aug 31 11:42:35 IST 2012 SEVERE: pageIndex selected: pageIndex0
Fri Aug 31 11:42:37 IST 2012 SEVERE: pageIndex selected: pageIndex1
Fri Aug 31 11:42:38 IST 2012 SEVERE: pageIndex selected: pageIndex2
Fri Aug 31 11:42:40 IST 2012 SEVERE: pageIndex selected: pageIndex0
Fri Aug 31 11:42:41 IST 2012 SEVERE: pageIndex selected: pageIndex1
Fri Aug 31 11:42:41 IST 2012 SEVERE: pageIndex selected: pageIndex2
Now update module descriptor `src/com.tutorialspoint/HelloWorld.gwt.xml` to enable popupHandler.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User'/>

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean'/>
  <inherits name="com.google.gwt.logging.Logging"/>

  <!-- Specify the app entry point class. -->
  <entry-point class='com.tutorialspoint.client.HelloWorld'/>

  <!-- Specify the paths for translatable code -->
  <source path='client'/>
  <source path='shared'/>
  <set-property name="gwt.logging.logLevel" value="SEVERE"/>
  <set-property name="gwt.logging.enabled" value="TRUE"/>
  <set-property name="gwt.logging.popupHandler" value="ENABLED"/>
</module>
```

Once you are ready with all the changes done, reload the application by refreshing the browser window (press F5/reload button of the browser). Notice a popup window is present now in upper left corner of the application.

Now click on 1, 2 or 3. You can notice, when you click on 1,2 or 3 ,you can see the log is getting printed displaying the pageIndex in the popup window.
We are on third Page.
