CSS - BORDER-WIDTH

Description

border-width is a shorthand property used to set the width of the four border sides of an element.

Possible Values

- **length** − Any length unit. Length units for this property may not be negative.

- **thin** − A border which is thinner than a border set to medium.

- **medium** − A border which is thicker than a border set to thin, and thinner than a border set to thick.

- **thick** − A border which is thicker than a border set to medium.

Applies to

All the HTML elements.

DOM Syntax

```
object.style.borderWidth = "2px";
```

Example

Following is the example to show all the border width −

```
<html>
   <head>
   </head>
   <body>
      <p style="border-width:4px; border-style:solid;">
      This is a solid border whose width is 4px.
      </p>

      <p style="border-width:4pt; border-style:solid;">
      This is a solid border whose width is 4pt.
      </p>

      <p style="border-width:thin; border-style:solid;">
      This is a solid border whose width is thin.
      </p>

      <p style="border-width:medium; border-style:solid;">
      This is a solid border whose width is medium;
      </p>

      <p style="border-width:thick; border-style:solid;">
      This is a solid border whose width is thick.
      </p>
   </body>
</html>
```

This will produce following result −
