CSS - FLOAT

Description

The *float* property causes an element to be moved to one side of the parent element.s content area, which allows other content to flow around it.

Possible Values

- **left** − The element is floated to the left side of its parent element's content area.

- **right** − The element is floated to the right side of its parent element's content area.

- **none** − The element is not floated.

Applies to

All the elements but positioned elements and generated content.

DOM Syntax

```
object.style.float = "left";
```

Example

Here is the example showing usage of this property:

```
<h1 style="float: left;">CSS float Example</h1>
<p>If your browser supports the CSS float Property, this text will be flowing  around
the heading.</p>
```

This will produce following result −

CSS FLOAT EXAMPLE
_____
                                    If your browser supports the CSS float Property, this
text will be flowing around the heading.
