

Description

The *font-family* property allows the author to provide a comma-separated list of specific font families, plus a generic type of font family, to be used in the rendering of an element's text.

Possible Values

- **font-family** – Comma-separated list of font families.

Applies to

All the HTML elements.

DOM Syntax

```
object.style.fontFamily = "georgia,garamond,serif";
```

Example

Here is the example using this property –

```
<html>
<head>
</head>
<body>
  <p style="font-family:georgia,garamond,serif;">
    This text is rendered in either georgia, garamond, or the default serif font
    depending on which font you have at your system.
  </p>
</body>
</html>
```

This will produce following result –
