CSS - FONT-WEIGHT

Description

The *font-weight* property alters the visual weight of characters in an element.

Possible Values

- **100, 200, 300, 400, 500, 600, 700, 800 and 900** − Defines from thin to thick characters. 400 is the same as normal, and 700 is the same as bold.

- **normal** − Default. Defines normal characters and equivalent to the value 400.

- **bold** − Equivalent to the value 700.

- **bolder** − The font characters for the element should be heavier than those of the parent element.

- **lighter** − The font characters for the element should be lighter than those of the parent element.

Applies to

All the HTML elements.

DOM Syntax

```
object.style.fontWeight = "900";
```

Example

Here is the example using this property −

```
<html>
   <head>
   </head>
   <body>
      <p style="font-weight:bold;">
      This font is bold.
      </p>

      <p style="font-weight:bolder;">
      This font is bolder.
      </p>

      <p style="font-weight:900;">
      This font is 900 weight.
      </p>
   </body>
</html>
```

This will produce following result −
