CSS gives you opportunity to create layers of various divisions. The CSS layers refer to applying the *z-index* property to elements that overlap with each other.

The *z-index* property is used along with the *position* property to create an effect of layers. You can specify which element should come on top and which element should come at bottom.

A *z-index* property can help you to create more complex webpage layouts. Following is the example which shows how to create layers in CSS.

```
<html>
  <head>
  </head>
  <body>
    <div style="background-color:red; width:300px; height:100px; position:relative;
top:10px; left:80px; z-index:2">
      </div>

    <div style="background-color:yellow; width:300px; height:100px; position:relative;
top:-60px; left:35px; z-index:1;">
      </div>

    <div style="background-color:green; width:300px; height:100px; position:relative;
top:-220px; left:120px; z-index:3;">
      </div>
  </body>
</html>
```

It will produce the following result –
