CSS - LETTER-SPACING

Description

The *letter-spacing* property modifies the amount of space placed between adjacent characters.

Possible Values

- **normal** − The default spacing between letters is not changed. In practice, this is equivalent to setting the value to 0.

- **length** − This will add to the spacing between letters - the greater the length, the more space will be seen between letters. Negative values are permitted.

Applies to

All the HTML elements.

DOM Syntax

```
object.style.letterSpacing = "5px;"
```

Example

Following is the example which demonstrates how to set the space between characters.

```
<p style="letter-spacing:5px;">
   This text is having space between letters.
</p>
```

This will produce following result −

```
This  text  is  having  space  between  letters.
```
