

CSS - LINE-HEIGHT

Description

The *line-height* property modifies the height of the inline boxes which make up a line of text.

Possible Values

- **normal** – Directs the browser to set the height of lines in the element to a "reasonable" distance.
- **number** – The actual height of lines in the element is this value multiplied by the font-size of the element.
- **length** – The height of lines in the element is the value given.
- **percentage** – The height of lines in the element is calculated as a percentage of the element's font-size.

Applies to

All the HTML elements.

DOM Syntax

```
object.style.lineHeight = "15px;"
```

Example

Following is the example –

```
<html>
  <head>
  </head>
  <body>
    <p style="line-height:180%">
      This text is having bigger line height. Line 1
      This text is having bigger line height. Line 2
    </p>
  </body>
</html>
```

This will produce following result –
