

## Description

The *page* property is used to invoke a page selector which has been previously defined using @page.

## Possible Values

- **<page selector>** – Any previously defined page selector using @page.
- **auto** – The browser should format the page according to its defaults.

## Applies to

All the block level elements.

## Example

Here is the example –

```
<style type="text/css">
  <!--
    @page wide { size : portrait }
    @page rotated { size : landscape }
    table { page : rotated }
  -->
</style>
```

For more detail please look into [CSS Paged Media](#).
