CSS - SPEAK

Description

The *speak* property is used to specify that the text will be used for aural media. It also specifies how it will be spoken, for example normal or spelt out.

Possible Values

- **normal** − Directs the user agent to speak the text using the pronunciation rules for that element and its children.

- **none** − Prevents the element from being spoken.

- **spell-out** − Causes the user agent to speak the text one letter at a time, which is useful for speaking acronyms.

DOM Syntax

```
object.style.speak = "spell-out";
```

Applies to

All the HTML elements

Example

Here is the example −

```
<style tyle="text/css">
   <!--
   acronym {speak: spell-out;}
   *.hidden {speak: none;}
   -->
</style>
```
