CSS - WHITE-SPACE

Description

The *white-space* property is used to alter the user agent's handling of whitespace in an element.

Possible Values

- **normal** − Any sequence of whitespaces within the element is converted to a single space.

- **pre** − All whitespace in the element is honored, including multiple spaces and carriage returns.

- **nowrap** − Any sequence of whitespaces within the element is converted to a single space, but word wrapping is disabled.

Applies to

All the Block level elements.

DOM Syntax

```
object.style.whiteSpace = "pre";
```

Example

Following is the example which demonstrates how white space inside an element is handled.

```
<html>
    <head>
    </head>
    <body>
        <p style="white-space:pre;">
        This text has a line break and the white-space pre setting tells the browser to
honor it just like the HTML pre tag.
        </p>
    </body>
</html>
```

This will produce following result −
