

# FLEX - PROGRESSBAR CONTROL

[http://www.tutorialspoint.com/flex/flex\\_progressbar\\_control.htm](http://www.tutorialspoint.com/flex/flex_progressbar_control.htm)

Copyright © tutorialspoint.com

## Introduction

The ProgressBar control provides users a visual representation of the progress of a task over time.

## Class declaration

Following is the declaration for **mx.controls.ProgressBar** class:

```
public class ProgressBar
    extends UIComponent
    implements IFontContextComponent
```

## Public properties

| S.N. | Property & Description                                                                                                      |
|------|-----------------------------------------------------------------------------------------------------------------------------|
| 1    | <b>alignToolTip : String = "Align"</b><br>The ToolTip that appears when the user hovers over the text alignment buttons.    |
| 2    | <b>conversion : Number</b><br>Number used to convert incoming current bytes loaded value and the total bytes loaded values. |
| 3    | <b>direction : String</b><br>Direction in which the fill of the ProgressBar expands toward completion.                      |
| 4    | <b>indeterminate : Boolean</b><br>Whether the ProgressBar control has a determinate or indeterminate appearance.            |
| 5    | <b>label : String</b><br>Text that accompanies the progress bar.                                                            |
| 6    | <b>labelPlacement : String</b>                                                                                              |
| 7    | <b>maximum : Number</b><br>Largest progress value for the ProgressBar.                                                      |
| 8    | <b>minimum : Number</b><br>Smallest progress value for the ProgressBar.                                                     |

|    |                                                                                                                                                           |
|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9  | <b>mode : String</b><br>Specifies the method used to update the bar.                                                                                      |
| 10 | <b>percentComplete : Number</b><br>[read-only] Percentage of process that is completed.The range is 0 to 100.                                             |
| 11 | <b>source : Object</b><br>Refers to the control that the ProgressBar is measuring the progress of.                                                        |
| 12 | <b>value : Number</b><br>[read-only] Read-only property that contains the amount of progress that has been made - between the minimum and maximum values. |

## Public methods

| S.N. | Method & Description                                                                                                                             |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | <b>ProgressBar</b><br>Constructor.                                                                                                               |
| 2    | <b>setProgressvalue: Number, total: Number: void</b><br>Sets the state of the bar to reflect the amount of progress made when using manual mode. |

## Events

| S.N. | Event & Description                                                                 |
|------|-------------------------------------------------------------------------------------|
| 1    | <b>complete</b><br>Dispatched when the load completes.                              |
| 2    | <b>hide</b><br>Dispatched when an object's state changes from visible to invisible. |
| 3    | <b>progress</b><br>Dispatched as content loads in event or polled mode.             |

**show**

Dispatched when the component becomes visible.

**Methods inherited**

This class inherits methods from the following classes:

- mx.core.UIComponent
- mx.core.FlexSprite
- flash.display.Sprite
- flash.display.DisplayObjectContainer
- flash.display.InteractiveObject
- flash.display.DisplayObject
- flash.events.EventDispatcher
- Object

**Flex ProgressBar Control Example**

Let us follow the following steps to check usage of ProgressBar control in a Flex application by creating a test application:

| Step | Description                                                                                                                                                   |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Create a project with a name <i>HelloWorld</i> under a package <i>com.tutorialspoint.client</i> as explained in the <i>Flex - Create Application</i> chapter. |
| 2    | Modify <i>HelloWorld.mxml</i> as explained below. Keep rest of the files unchanged.                                                                           |
| 3    | Compile and run the application to make sure business logic is working as per the requirements.                                                               |

Following is the content of the modified mxml file **src/com.tutorialspoint/HelloWorld.mxml**.

```
<?xml version="1.0" encoding="utf-8"?>
<s:Application xmlns:fx="http://ns.adobe.com/mxml/2009"
  xmlns:s="library://ns.adobe.com/flex/spark"
  xmlns:mx="library://ns.adobe.com/flex/mx"
  width="100%" height="100%" minWidth="500" minHeight="500"
  >
  <fx:Style source="/com/tutorialspoint/client/Style.css"/>
  <fx:Script>
    <![CDATA[
      private var increment:uint=10;

      private function runProgressBar():void
      {
        if(increment <= 100)
        {
          progressBar.setProgress(increment,100);
          progressBar.label= "Current Progress" + " " + increment + "%";
          increment+=10;
        }
        if(increment > 100)
        {
```

```

        increment=0;
    }
}
]]>
</fx:Script>
<s:BorderContainer width="630" height="480"
    styleName="container">
    <s:VGroup width="100%" height="100%" gap="50"
        horizontalAlign="center" verticalAlign="middle">
        <s:Label
            fontSize="40" color="0x777777" styleName="heading"/>
        <s:Panel
            width="500" height="300">
            <s:layout>
                <s:VerticalLayout gap="10" verticalAlign="middle"
                    horizontalAlign="center"/>
            </s:layout>
            <s:Label color="0x323232"
                text="Click the button to start the progress bar." />
            <s:Button
                click="runProgressBar();" />
            <mx:ProgressBar
                labelPlacement="bottom" minimum="0"
                visible="true" maximum="100"
                color="0x323232" label="CurrentProgress 0%"
                direction="right" mode="manual" width="90%"/>
            </s:Panel>
        </s:VGroup>
    </s:BorderContainer>
</s:Application>

```

Once you are ready with all the changes done, let us compile and run the application in normal mode as we did in [Flex - Create Application](#) chapter. If everything is fine with your application, this will produce following result: [ [Try it online](#) ]

Loading [MathJax]/jax/output/HTML-CSS/jax.js
