The Hypertext Transfer Protocol *HTTP* is an application-level protocol for distributed, collaborative, hypermedia information systems. This is the foundation for data communication for the World Wide Web *i. e. internet* since 1990. HTTP is a generic and stateless protocol which can be used for other purposes as well using extensions of its request methods, error codes, and headers.

This tutorial is based on RFC-2616 specification, which defines the protocol referred to as HTTP/1.1. HTTP/1.1 is a revision of the original HTTP *HTTP/1.0*. A major difference between HTTP/1.0 and HTTP/1.1 is that HTTP/1.0 uses a new connection for each request/response exchange, where as HTTP/1.1 connection may be used for one or more request/response exchanges.

AUDIENCE

This tutorial has been prepared for computer science graduates and web developers to help them understand the basic to advanced level concepts related to Hypertext Transfer Protocol *HTTP*.

PREREQUISITES

Before proceeding with this tutorial, it is good to have a basic understanding of web concepts, web browsers, web servers, client and server architecture based software.
