Introduction

The **java.lang.Compiler** class is provided to support Java-to-native-code compilers and related services. By design, it serves as a placeholder for a JIT compiler implementation.

Class declaration

Following is the declaration for **java.lang.Compiler** class:

```
public final class Compiler
    extends Object
```

Class methods

S.N.	Method & Description
1	<u>static Object commandObjectany</u> This method examines the argument type and its fields and perform some documented operation.
2	<u>static boolean compileClassClass < ? > clazz</u> This method compiles the specified class.
3	<u>static void disable</u> This method causes the Compiler to cease operation.
4	<u>static boolean compileClassesStringstring</u> This method compiles all classes whose name matches the specified string..
5	<u>static void enable</u> This method cause the Compiler to resume operation.

Methods inherited

This class inherits methods from the following classes:

• java.lang.Object
