Description

The **java.lang.Long.reverse** method returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified long value.

Declaration

Following is the declaration for **java.lang.Long.reverse** method

```
public static long reverse(long i)
```

Parameters

- **i** -- This is the long value.

Return Value

This method returns the value obtained by reversing order of the bits in the specified long value.

Exception

- **NA**

Example

The following example shows the usage of java.lang.Long.reverse method.

```
package com.tutorialspoint;

import java.lang.*;

public class LongDemo {

    public static void main(String[] args) {

        long l = 210;
        System.out.println("Number = " + l);

        /* returns the string representation of the unsigned long value
        represented by the argument in binary (base 2) */
        System.out.println("Binary = " + Long.toBinaryString(l));

        /* returns the value obtained by reversing order of the bits in the
        specified long value */
        System.out.println("After reversing = " + Long.reverse(l));
    }
}
```

Let us compile and run the above program, this will produce the following result:

```
Number = 210
Binary = 11010010
After reversing = 5404319552844595200
```
