

JAVA.LANG.RUNTIME.EXEC METHOD

http://www.tutorialspoint.com/java/lang/runtime_exec.htm

Copyright © tutorialspoint.com

Description

The **java.lang.Runtime.execStringCommand** method executes the specified string command in a separate process. This is a convenience method. An invocation of the form `execCommand` behaves in exactly the same way as the invocation `execCommand, null, null`.

Declaration

Following is the declaration for **java.lang.Runtime.exec** method

```
public Process exec(String command)
```

Parameters

- **command** -- a specified system command.

Return Value

This method returns a new Process object for managing the subprocess

Exception

- **SecurityException** -- If a security manager exists and its `checkExec` method doesn't allow creation of the subprocess
- **IOException** -- If an I/O error occurs
- **NullPointerException** -- If command is null
- **IllegalArgumentException** -- If command is empty

Example

The following example shows the usage of `lang.Runtime.exec` method.

```
package com.tutorialspoint;

public class RuntimeDemo {

    public static void main(String[] args) {
        try {

            // print a message
            System.out.println("Executing notepad.exe");

            // create a process and execute notepad.exe
            Process process = Runtime.getRuntime().exec("notepad.exe");

            // print another message
            System.out.println("Notepad should now open.");

        } catch (Exception ex) {
            ex.printStackTrace();
        }
    }
}
```

Let us compile and run the above program, this will produce the following result:

Executing notepad.exe

Notepad should now open.
