

JAVA.LANG.STRINGBUILDER.SETLENGTH METHOD

http://www.tutorialspoint.com/java/lang/stringbuilder_setlength.htm

Copyright © tutorialspoint.com

Description

The **java.lang.StringBuilder.setLength** method sets the length of the character sequence. The sequence is changed to a new character sequence whose length is specified by the argument.

If the **newLength** argument is greater than or equal to the current length, sufficient null characters `'\u0000'` are appended so that length becomes the **newLength** argument.

Declaration

Following is the declaration for **java.lang.StringBuilder.setLength** method

```
public void setLength(int newLength)
```

Parameters

- **newLength** -- This is the new length.

Return Value

This method does not return any value.

Exception

- **IndexOutOfBoundsException** -- if the newLength argument is negative.

Example

The following example shows the usage of java.lang.StringBuilder.setLength method.

```
package com.tutorialspoint;

import java.lang.*;

public class StringBuilderDemo {

    public static void main(String[] args) {

        StringBuilder str = new StringBuilder("tutorials");
        System.out.println("string = " + str);
        // length of StringBuilder
        System.out.println("length = " + str.length());

        // set the length of StringBuilder to 5
        str.setLength(5);

        // print new StringBuilder value after changing length
        System.out.println("After set, string = " + str);
        // length of StringBuilder after changing length
        System.out.println("length = " + str.length());
    }
}
```

Let us compile and run the above program, this will produce the following result:

```
string = tutorials
length = 9
After set, string = tutor
length = 5
```
