

JAVA - FILEREADER CLASS

http://www.tutorialspoint.com/java/java_filereader_class.htm

Copyright © tutorialspoint.com

This class inherits from the `InputStreamReader` class. `FileReader` is used for reading streams of characters.

This class has several constructors to create required objects. Below given are the list of constructors provided by the `FileReader` class.

SR.NO Constructors and Description

- | | |
|---|--|
| 1 | <code>FileReaderFilefile</code>
This constructor creates a new <code>FileReader</code> , given the <code>File</code> to read from. |
| 2 | <code>FileReaderFileDescriptorfd</code>
This constructor creates a new <code>FileReader</code> , given the <code>FileDescriptor</code> to read from. |
| 3 | <code>FileReaderStringfileName</code>
This constructor creates a new <code>FileReader</code> , given the name of the file to read from. |

Once you have `FileReader` object in hand then there is a list of helper methods which can be used to manipulate the files

SR.NO Methods with Description

- | | |
|---|--|
| 1 | <code>public int read throws IOException</code>
Reads a single character. Returns an <code>int</code> , which represents the character read. |
| 2 | <code>public int read(char[]c, intoffset, intlen)</code>
Reads characters into an array. Returns the number of characters read. |

Example:

Following is the example to demonstrate class:

```
import java.io.*;

public class FileRead{

    public static void main(String args[])throws IOException{

        File file = new File("Hello1.txt");
        // creates the file
        file.createNewFile();
        // creates a FileWriter Object
        FileWriter writer = new FileWriter(file);
        // Writes the content to the file
        writer.write("This\n is\n an\n example\n");
        writer.flush();
        writer.close();
    }
}
```

```
//Creates a FileReader Object
FileReader fr = new FileReader(file);
char [] a = new char[50];
fr.read(a); // reads the content to the array
for(char c : a)
    System.out.print(c); //prints the characters one by one
fr.close();
}
```

This would produce the following result:
