

JAVA.UTIL.ARRAYDEQUE.PEEKLAST METHOD

http://www.tutorialspoint.com/java/util/arraydeque_peeklast.htm

Copyright © tutorialspoint.com

Description

The **java.util.ArrayDeque.peekLast** method retrieves the last **element** of this **deque** *but does not remove*. Returns **null** if this deque is empty.

Declaration

Following is the declaration for **java.util.ArrayDeque.peekLast** method

```
public E peekLast()
```

Parameters

- NA

Return Value

This method returns the **tail** of this deque, or **null** if this deque is empty.

Exception

- NA

Example

The following example shows the usage of java.util.ArrayDeque.peekLast method.

```
package com.tutorialspoint;

import java.util.ArrayDeque;
import java.util.Deque;

public class ArrayDequeDemo {
    public static void main(String[] args) {

        // create an empty array deque with an initial capacity
        Deque<Integer> deque = new ArrayDeque<Integer>(8);

        // use add() method to add elements in the deque
        deque.add(25);
        deque.add(30);
        deque.add(20);
        deque.add(18);

        // this will retrieve end value
        int retval = deque.peekLast();
        System.out.println("Retrieved Element is " + retval);

        // printing all the elements available in deque
        for (Integer number : deque) {
            System.out.println("Number = " + number);
        }
    }
}
```

Let us compile and run the above program, this will produce the following result:

```
Retrieved Element is 18
Number = 25
Number = 30
```

Number = 20
Number = 18
