

JAVA.UTIL.ARRAYS.TOSTRINGCHAR[] METHOD

http://www.tutorialspoint.com/java/util/arrays_tostring_char.htm

Copyright © tutorialspoint.com

Description

The **java.util.Arrays.toString(char[])** method returns a string representation of the contents of the specified char array. The string representation consists of a list of the array's elements, enclosed in square brackets "[]" . Adjacent elements are separated by the characters ", "

acomma followed by a space.

Declaration

Following is the declaration for **java.util.Arrays.toString** method

```
public static String toString(char[] a)
```

Parameters

- **a** -- This is the array whose string representation to return.

Return Value

This method returns a string representation of *a*.

Exception

- **NA**

Example

The following example shows the usage of java.util.Arrays.toString method.

```
package com.tutorialspoint;

import java.util.Arrays;

public class ArrayDemo {

    public static void main(String[] args) {

        // initializing char array
        char[] c1 = new char[] { 'd', 'e', 'f' };

        // let us print all the values available in list
        System.out.println("The array is:");
        for (char value : c1) {
            System.out.println("Value = " + value);
        }

        System.out.println("The string representation of array is:");
        System.out.println(Arrays.toString(c1));
    }
}
```

Let us compile and run the above program, this will produce the following result:

```
The array is:
Value = d
Value = e
Value = f
The string representation of array is:
[d, e, f]
```
