

JAVA.UTIL.ARRAYS.TOSTRINGFLOAT[] METHOD

http://www.tutorialspoint.com/java/util/arrays_tostring_float.htm

Copyright © tutorialspoint.com

Description

The **java.util.Arrays.toString(float[])** method returns a string representation of the contents of the specified float array. The string representation consists of a list of the array's elements, enclosed in square brackets "[]" . Adjacent elements are separated by the characters ", " *acomma followed by a space*.

Declaration

Following is the declaration for **java.util.Arrays.toString** method

```
public static String toString(float[] a)
```

Parameters

- **a** -- This is the array whose string representation to return.

Return Value

This method returns a string representation of *a*.

Exception

- **NA**

Example

The following example shows the usage of java.util.Arrays.toString method.

```
package com.tutorialspoint;

import java.util.Arrays;

public class ArrayDemo {

    public static void main(String[] args) {

        // initializing float array
        float[] f1 = new float[] { 1.2f, 9.7f, 3.4f };

        // let us print all the elements available in list
        System.out.println("The array is:");
        for (float number : f1) {
            System.out.println("Number = " + number);
        }

        System.out.println("The string representation of array is:");
        System.out.println(Arrays.toString(f1));
    }
}
```

Let us compile and run the above program, this will produce the following result:

```
The array is:
Number = 1.2
Number = 9.7
Number = 3.4
The string representation of array is:
[1.2, 9.7, 3.4]
```
