Problem Description:

How to create a new file?

Solution:

This example demonstrates the way of creating a new file by using File constructor and file.createNewFile method of File class.

```
import java.io.File;
import java.io.IOException;

public class Main {
    public static void main(String[] args) {
        try{
            File file = new File("C:/myfile.txt");
            if(file.createNewFile())
                System.out.println("Success!");
            else
                System.out.println
                    ("Error, file already exists.");
        }
        catch(IOException ioe) {
            ioe.printStackTrace();
        }
    }
}
```

Result:

The above code sample will produce the following result if " myfile.txt does not exist before

Success!
