Learn how to play with methods in Java programming. Here are most commonly used examples:

- [How to overload methods?](#)
- [How to use method overloading for printing different types of array?](#)
- [How to use method for solving Tower of Hanoi problem?](#)
- [How to use method for calculating Fibonacci series?](#)
- [How to use method for calculating Factorial of a number?](#)
- [How to use method overriding in Inheritance for subclasses?](#)
- [How to display Object class using instanceof keyword?](#)
- [How to use break to jump out of a loop in a method?](#)
- [How to use continue in a method?](#)
- [How to use Label in a method?](#)
- [How to use enum & switch statement ?](#)
- [How to make enum constructor, instance variable & method?](#)
- [How to use for and foreach loop for printing values of an array ?](#)
- [How to make a method take variable length argument as an input?](#)
- [How to use variable arguments as an input when dealing with method overloading?](#)
