Problem Description:

How to format strings ?

Solution:

Following example returns a formatted string value by using a specific locale, format and arguments in format method

```
import java.util.*;

public class StringFormat{
    public static void main(String[] args){
        double e = Math.E;
        System.out.format("%f%n", e);
        System.out.format(Locale.GERMANY, "%-10.4f%n%n", e);
    }
}
```

Result:

The above code sample will produce the following result.

```
2.718282
2.7182
```
