Description

JavaScript date **toLocaleTimeString** method converts a date to a string, returning the "date" portion using the current locale's conventions.

The toLocaleTimeString method relies on the underlying operating system in formatting dates. It converts the date to a string using the formatting convention of the operating system where the script is running. For example, in the United States, the month appears before the date 04/15/98, whereas in Germany, the date appears before the month 15.04.98.

Syntax

Its syntax is as follows –

```
Date.toLocaleTimeString ()
```

Return Value

Returns the formatted date in a string format.

Example

Try the following example.

```
<html>
  <head>
    <title>JavaScript toLocaleTimeString Method</title>
  </head>
  <body>
    <script type="text/javascript">
      var dt = new Date(1993, 6, 28, 14, 39, 7);
      document.write( "Formatted Date : " + dt.toLocaleTimeString() );
    </script>
  </body>
</html>
```

Output

```
Formatted Date : 2:39:07 PM
Loading [MathJax]/jax/output/HTML-CSS/jax.js
```
