

JAVASCRIPT STRING - SPLIT METHOD

http://www.tutorialspoint.com/javascript/string_split.htm

Copyright © tutorialspoint.com

Description

This method splits a String object into an array of strings by separating the string into substrings.

Syntax

Its syntax is as follows –

```
string.split([separator][, limit]);
```

Argument Details

- **separator** – Specifies the character to use for separating the string. If *separator* is omitted, the array returned contains one element consisting of the entire string.
- **limit** – Integer specifying a limit on the number of splits to be found.

Return Value

The split method returns the new array. Also, when the string is empty, split returns an array containing one empty string, rather than an empty array.

Example

Try the following example.

```
<html>
  <head>
    <title>JavaScript String split() Method</title>
  </head>

  <body>

    <script type="text/javascript">
      var str = "Apples are round, and apples are juicy.";
      var splitted = str.split(" ", 3);

      document.write( splitted );
    </script>

  </body>
</html>
```

Output

Apples are round
