PERL BIND FUNCTION

Description

This function binds the network ADDRESS to the filehandle identified by SOCKET. The ADDRESS should be a packed address of the appropriate type for the socket being opened.

Syntax

Following is the simple syntax for this function −

```
bind SOCKET, ADDRESS
```

Return Value

This function returns 0 on failure and 1 on success.

Example

Following is the example code showing its basic usage −

```
#!/usr/bin/perl
```
