

PERL - OPERATORS

What is an Operator?

Simple answer can be given using the expression $4 + 5$ is equal to 9. Here 4 and 5 are called operands and + is called operator. Perl language supports many operator types, but following is a list of important and most frequently used operators –

- Arithmetic Operators
- Equality Operators
- Logical Operators
- Assignment Operators
- Bitwise Operators
- Logical Operators
- Quote-like Operators
- Miscellaneous Operators

Lets have a look at all the operators one by one.

Perl Arithmetic Operators

Assume variable *a* holds 10 and variable *b* holds 20 then –

[\[Show Example \]](#)

Operator	Description	Example
+	Addition - Adds values on either side of the operator	$a + b$ will give 30
-	Subtraction - Subtracts right hand operand from left hand operand	$a - b$ will give -10
*	Multiplication - Multiplies values on either side of the operator	$a * b$ will give 200
/	Division - Divides left hand operand by right hand operand	b/a will give 2
%	Modulus - Divides left hand operand by right hand operand and returns remainder	$b \% a$ will give 0
**	Exponent - Performs exponential power calculation on operators	$a ** b$ will give 10 to the power 20

Perl Equality Operators

These are also called relational operators. Assume variable *a* holds 10 and variable *b* holds 20 then, lets check the following numeric equality operators –

[\[Show Example \]](#)

Operator	Description	Example
$==$	Checks if the value of two operands are equal or	$\$a == \b is not true.

	not, if yes then condition becomes true.	
!=	Checks if the value of two operands are equal or not, if values are not equal then condition becomes true.	$\$a \neq \b is true.
<= >	Checks if the value of two operands are equal or not, and returns -1, 0, or 1 depending on whether the left argument is numerically less than, equal to, or greater than the right argument.	$\$a \leq \b returns -1.
>	Checks if the value of left operand is greater than the value of right operand, if yes then condition becomes true.	$\$a > \b is not true.
<	Checks if the value of left operand is less than the value of right operand, if yes then condition becomes true.	$\$a < \b is true.
>=	Checks if the value of left operand is greater than or equal to the value of right operand, if yes then condition becomes true.	$\$a \geq \b is not true.
<=	Checks if the value of left operand is less than or equal to the value of right operand, if yes then condition becomes true.	$\$a \leq \b is true.

Below is a list of equity operators. Assume variable *a* holds "abc" and variable *b* holds "xyz" then, lets check following string equality operators:

[\[Show Example \]](#)

Operator	Description	Example
lt	Returns true if the left argument is stringwise less than the right argument.	$\$a < \b is true.
gt	Returns true if the left argument is stringwise greater than the right argument.	$\$a > \b is false.
le	Returns true if the left argument is stringwise less than or equal to the right argument.	$\$a \leq \b is true.
ge	Returns true if the left argument is stringwise greater than or equal to the right argument.	$\$a \geq \b is false.
eq	Returns true if the left argument is stringwise equal to the right argument.	$\$a == \b is false.
ne	Returns true if the left argument is stringwise not equal to the right argument.	$\$a != \b is true.
cmp	Returns -1, 0, or 1 depending on whether the left argument is stringwise less than, equal to, or greater than the right argument.	$\$a \text{ cmp } \b is -1.

Perl Assignment Operators

Assume variable *a* holds 10 and variable *b* holds 20, then –

[\[Show Example \]](#)

Operator	Description	Example
=	Simple assignment operator, Assigns values from right side operands to left side operand	$c = a + b$ will assign value of $a + b$ to c
+=	Add AND assignment operator, It adds right operand to the left operand and assign the result to left operand	$c += a$ is equivalent to $c = c + a$
-=	Subtract AND assignment operator, It subtracts right operand from the left operand and assign the result to left operand	$c -= a$ is equivalent to $c = c - a$
*=	Multiply AND assignment operator, It multiplies right operand with the left operand and assign the result to left operand	$c *= a$ is equivalent to $c = c * a$
/=	Divide AND assignment operator, It divides left operand with the right operand and assign the result to left operand	$c /= a$ is equivalent to $c = c / a$
%=	Modulus AND assignment operator, It takes modulus using two operands and assign the result to left operand	$c \% a$ is equivalent to $c = c \% a$
**=	Exponent AND assignment operator, Performs exponential power calculation on operators and assign value to the left operand	$c **= a$ is equivalent to $c = c ** a$

Perl Bitwise Operators

Bitwise operator works on bits and perform bit by bit operation. Assume if $a = 60$; $b = 13$; Now in binary format they will be as follows –

$\$a = 0011\ 1100$

$\$b = 0000\ 1101$

a&b = 0000 1100

$a|b = 0011\ 1101$

a^b = 0011 0001

$\sim a = 1100\ 0011$

There are following Bitwise operators supported by Perl language

[\[Show Example \]](#)

Operator	Description	Example
&	Binary AND Operator copies a bit to the result if it exists in both operands.	$\$a \& \b will give 12 which is 0000 1100
	Binary OR Operator copies a bit if it exists in either operand.	$\$a \b will give 61 which is 0011 1101
^	Binary XOR Operator copies the bit if it is set in one operand but not both.	$\$a \b will give 49 which is 0011 0001
~	Binary Ones Complement Operator is unary and	$\$a$ will give -61 which is 1100

	has the effect of 'flipping' bits.	0011 in 2's complement form due to a signed binary number.
<<	Binary Left Shift Operator. The left operand's value is moved left by the number of bits specified by the right operand.	\$a << 2 will give 240 which is 1111 0000
>>	Binary Right Shift Operator. The left operand's value is moved right by the number of bits specified by the right operand.	\$a >> 2 will give 15 which is 0000 1111

Perl Logical Operators

There are following logical operators supported by Perl language. Assume variable *a* holds true and variable *b* holds false then –

[\[Show Example \]](#)

Operator	Description	Example
and	Called Logical AND operator. If both the operands are true then the condition becomes true.	\$a and \$b is false.
&&	C-style Logical AND operator copies a bit to the result if it exists in both operands.	\$a && \$b is false.
or	Called Logical OR Operator. If any of the two operands are non zero then the condition becomes true.	\$a or \$b is true.
	C-style Logical OR operator copies a bit if it exists in either operand.	\$a \$b is true.
not	Called Logical NOT Operator. Use to reverses the logical state of its operand. If a condition is true then Logical NOT operator will make false.	not \$a and \$b is true.

Quote-like Operators

There are following Quote-like operators supported by Perl language. In the following table, a {} represents any pair of delimiters you choose.

[\[Show Example \]](#)

Operator	Description	Example
q{ }	Encloses a string with-in single quotes	q{abcd} gives 'abcd'
qq{ }	Encloses a string with-in double quotes	qq{abcd} gives "abcd"
qx{ }	Encloses a string with-in invert quotes	qx{abcd} gives `abcd`

Miscellaneous Operators

There are following miscellaneous operators supported by Perl language. Assume variable *a* holds 10 and variable *b* holds 20 then –

[\[Show Example \]](#)

Operator	Description	Example
.	Binary operator dot . concatenates two strings.	If $a = "abc"$, $b = "def"$ then $a.b$ will give "abcdef"
x	The repetition operator x returns a string consisting of the left operand repeated the number of times specified by the right operand.	$'-'x3$ will give ---.
..	The range operator .. returns a list of values counting <i>upbyones</i> from the left value to the right value	2..5 will give 2, 3, 4, 5
++	Auto Increment operator increases integer value by one	$$a++$ will give 11
--	Auto Decrement operator decreases integer value by one	$$a--$ will give 9
->	The arrow operator is mostly used in dereferencing a method or variable from an object or a class name	$obj->a$ is an example to access variable <i>a</i> from object <i>obj</i> .

Perl Operators Precedence

The following table lists all operators from highest precedence to lowest.

[[Show Example](#)]

```

left terms and list operators (leftward)
left ->
nonassoc ++ --
right ** 
right ! ~ \ and unary + and -
left =~ !~
left * / % x
left + - .
left << >>
nonassoc named unary operators
nonassoc < > <= >= lt gt le ge
nonassoc == != <=> eq ne cmp ~~
left &
left | ^
left &&
left || //
nonassoc .. ...
right ?:
right += -= *= etc.
left , =>
nonassoc list operators (rightward)
right not
left and
left or xor

```
