## Description

This function is equivalent to the underlying C and operating system call `open`. Opens the file specified by `FILENAME`, associating it with `FILEHANDLE`. The `MODE` argument specifies how the file should be opened. The values of `MODE` are system dependent, but some values are historically set. Values of 0, 1, and 2 mean read-only, write-only, and read/write, respectively. The supported values are available in the `Fcntl` module, and are summarized in below Table.

Note that `FILENAME` is strictly a file name; no interpretation of the contents takes place *unlike* `open`, and the mode of opening is defined by the `MODE` argument.

If the file has to be created, and the `O_CREAT` flag has been specified in `MODE`, then the file is created with the permissions of `PERMS`. The value of `PERMS` must be specified in traditional Unix-style hexadecimal. If `PERMS` is not specified, then Perl uses a default mode of 0666 *read/write on user/group/other*.

Flag	Description
<code>O_RDONLY</code>	Read only.
<code>O_WRONLY</code>	Write only.
<code>O_RDWR</code>	Read and write.
<code>O_CREAT</code>	Create the file if it doesn't already exist.
<code>O_EXCL</code>	Fail if the file already exists.
<code>O_APPEND</code>	Append to an existing file.
<code>O_TRUNC</code>	Truncate the file before opening.
<code>O_NONBLOCK</code>	Non-blocking mode.
<code>O_NDELAY</code>	Equivalent of <code>O_NONBLOCK</code> .
<code>O_EXLOCK</code>	Lock using <code>flock</code> and <code>LOCK_EX</code> .
<code>O_SHLOCK</code>	Lock using <code>flock</code> and <code>LOCK_SH</code> .
<code>O_DIRECTORY</code>	Fail if the file is not a directory.
<code>O_NOFOLLOW</code>	Fail if the last path component is a symbolic link.
<code>O_BINARY</code>	Open in binary mode (implies a call to <code>binmode</code> ).
<code>O_LARGEFILE</code>	Open with large (>2GB) file support.
<code>O_SYNC</code>	Write data physically to the disk, instead of write buffer.
<code>O_NOCTTY</code>	Don't make the terminal file being opened the processes controlling terminal, even if you don't have one yet.

## Syntax

Following is the simple syntax for this function –

```
sysopen FILEHANDLE, FILENAME, MODE, PERMS  
  
sysopen FILEHANDLE, FILENAME, MODE
```

## Return Value

This function returns 0 on failure and 1 on success.

## Example

Following is the example code showing its basic usage –

```
#!/usr/bin/perl  
use strict;  
use warnings;  
my $file = "example.txt";  
my $mode = "w";  
my $perms = 0666;  
my $fh = sysopen($file, $mode, $perms);  
if ($fh) {  
    print "File opened successfully.\n";  
} else {  
    print "Failed to open file.\n";  
}
```

When above code is executed, it produces the following result –

```
Loading [MathJax]/jax/output/HTML-CSS/fonts/TeX/fontdata.js
```
