Description

This callback function is called when a drag is in progress. This is the preferred callback for drag event.

Syntax

```
new Draggable('element', {change: 'effectFunction'});
```

Here effectFunction is the function, which defines the effect to be applied.

Example

```
<html>
<head>
  <title>Draggables Elements</title>

  <script type="text/javascript" src="/javascript/prototype.js"></script>
  <script type="text/javascript" src="/javascript/scriptaculous.js"></script>

  <script type="text/javascript">
    window.onload = function(){
      new Draggable('myimage',
        {
          change : function(){
            new Effect.Opacity('myimage', {from:0, to:1.0, duration:1});
          }
        }
      );
    }
  </script>
</head>
<body>

  <p>While you drag this image it become disappear.</p>
  <img />

</body>
</html>
```

This will produce following result –
