

## What is Fuzz Testing?

Fuzz testing is a software testing technique using which a random data is given as the inputs to the system. If the application fails, then those issues/defects are to be addressed by the system. In short, unexpected or random inputs might lead to unexpected results.

## Fuzz Testing Phases:

Following are the key phases for fuzz testing:

## Attack Types

- Number/Character Fuzzing
- Application Fuzzing
- Protocol Fuzzing
- File Format Fuzzing
