

TESTNG JUNIT REPORTS

http://www.tutorialspoint.com/testng/testng_junitreports.htm

Copyright © tutorialspoint.com

JUnit is one of those unit frameworks which were initially used by many Java applications as a Unit test framework. By default, JUnit tests generate simple report XML files for its test execution. These XML files can then be used to generate any custom reports as per the testing requirement. We can also generate HTML reports using the XML files. Ant has such a utility task, which takes these JUnit XML files as input and generates an HTML report.

TestNG, by default, generates JUnit XML reports for any test execution (in the *test-output* folder). We can use these XML report files as input for generating a JUnit HTML report. Let us take an example.

Create Test Case Class

Create a java class, say, SampleTest.java in **C:\ > TestNG_WORKSPACE**.

```
import org.testng.Assert;
import org.testng.annotations.Test;

public class SampleTest {
    @Test
    public void testMethodOne(){
        Assert.assertTrue(true);
    }

    @Test
    public void testMethodTwo(){
        Assert.assertTrue(false);
    }

    @Test(dependsOnMethods={"testMethodTwo"})
    public void testMethodThree(){
        Assert.assertTrue(true);
    }
}
```

The preceding test class contains three test methods out of which *testMethodOne* and *testMethodThree* will pass when executed, whereas *testMethodTwo* is made to fail by passing a *false* Boolean value to the *Assert.assertTrue* method, which is used for truth conditions in the tests.

Create testng.xml

Create testng.xml in **C:\ > TestNG_WORKSPACE** to execute test cases.

```
<?xml version="1.0" encoding="UTF-8"?>
<suite name="Simple Suite">

    <test name="Simple test">
        <classes>
            <class name="SampleTest" />
        </classes>
    </test>
</suite>
```

Compile the SampleTest class using javac.

```
C:\TestNG_WORKSPACE>javac SampleTest.java
```

Now, run testng.xml.

```
C:\TestNG_WORKSPACE>java -cp "C:\TestNG_WORKSPACE" org.testng.TestNG testng.xml
```

Verify the output.

```
=====
Simple Suite
Total tests run: 3, Failures: 1, Skips: 1
=====
```

Now that we have JUnit XML reports available from the above execution, let's create a simple Ant build configuration XML file to generate an HTML report for the test execution.

Create a new file named build.xml under **C:\ > TestNG_WORKSPACE** folder.

```
<project name="TestNG_WORKSPACE" default="junit-report" basedir=".">
  <!-- Sets the property variables to point to respective directories -->
  <property name="junit-xml-dir" value="${basedir}/test-output/junitreports"/>
  <property name="report-dir" value="${basedir}/html-report" />

  <!-- Ant target to generate html report -->
  <target name="junit-report">
    <!-- Delete and recreate the html report directories -->
    <delete dir="${report-dir}" failonerror="false"/>
    <mkdir dir="${report-dir}" />
    <mkdir dir="${report-dir}/JUnit" />
    <!-- Ant task to generate the html report.
    todir - Directory to generate the output reports

    fileset - Directory to look for the junit xml reports.

    report - defines the type of format to be generated.
    Here we are using "noframes" which generates a single html report.
    -->
    <junitreport todir="${report-dir}/JUnit">
      <fileset dir="${junit-xml-dir}">
        <include name="**/*.xml" />
      </fileset>
      <report format="noframes" todir="${report-dir}/JUnit" />
    </junitreport>
  </target>
</project>
```

The preceding XML defines a simple Ant build.xml file having a specific Ant target named junit-report that generates a JUnit report when executed. The target looks for the JUnit report XML files under the directory test-output/junitreports. For the Ant configuration file, the default target to execute is configured as junit-report.

Open the command prompt window and go to the C:\ > TestNG_WORKSPACE directory in the command prompt and run the command:

```
C:\TestNG_WORKSPACE> ant
```

Once executed, a JUnit HTML report will be generated in the configured directory /html-report/Junit. Open the file named junit-noframes.html on your default web browser. You will see the following HTML report:

Unit Test Results.

Designed for use with [JUnit](#) and [TestNG](#)

Summary

Tests	Failures	Errors	Success rate	Time
3	1	1	33.33%	0.00s

Note: failures are anticipated and checked for with assertions while errors are unanticipated.

Packages

Note: package statistics are not computed recursively; they only sum up all of its test suite numbers.

Name	Tests	Errors	Failures	Time(s)	Time Stamp	Host
	3	1	1	0.00s	27-Aug-2013 13:35:13 GMT	marvishu-Lenovo-G500

Package

Name	Tests	Errors	Failures	Time(s)	Time Stamp	Host
SimpleTest	3	1	1	0.00s	27-Aug-2013 13:35:13 GMT	marvishu-Lenovo-G500

Test Case SampleTest:

Name	Status	Type	Time(s)
testMethodThree	Success		0.000
testMethodTwo	Error	expected [true] but found [false]	0.000
		java.lang.AssertionError: expected [true] but found [false] at org.testng.Assert.fail(Assert.java:91) at org.testng.Assert.failNotEquals(Assert.java:145) at org.testng.Assert.assertTrue(Assert.java:55)	

Here, we have seen how to use the JUnit XML report generated by TestNG and generate HTML report using Ant. There are two kinds of reports that can be generated using this method: **frames** and **no-frames**. If the report generation is configured with **frames**, there will be multiple files generated for each class and the main report will connect to them through links. A **no-frames** report consists of a single file with all the results of the test execution. This can be configured by providing the respective value to the format attribute of the report task in Ant.
