What are ByRef Parameters?

If **ByRef** is specified, then the arguments are sent as a reference when the function or procedure is called.

Example

```
<!DOCTYPE html>
<html>
<body>
<script language="vbscript" type="text/vbscript">

Function fnadd(ByRef num1, ByRef num2)
    num1 = 4
    num2 = 5
End Function

Dim x,y
x=6
y=4
res= fnadd(x,y)
document.write("The value of x is " & x & "<br />")
document.write("The value of y is " & y & "<br />")

</script>
</body>
</html>
```

The above function takes the parameter x and y as by reference. Hence, after executing the function, the values are changed.

If the above function is saved as .html and executed in IE, the output would be as follows:

```
The value of x is 4
The value of y is 5
```
