A WAP device is a combination of hardware and software capable of running a WAP-compliant microbrowser, such as a WAP-enabled mobile phone or a PDA.

A PC can also be used as a WAP device, if you download a WAP phone emulator from one of the developer sites. The emulator allows you to use a virtual phone on your desktop. Some major suppliers such as Ericsson, Nokia, and Openwave, have developer sites where you can download software development kits *SDKs* containing WAP emulators.

A WAP phone can run any WAP application in the same way that a Web browser can run any HTML application. Once you have a WAP phone, you can access the Internet simply by entering URLs and following the links that appear.

Using these devices, easy and secure access to Internet content and services such as banking, leisure, and unified messaging is made available. Furthermore, access is not restricted to the Internet, WAP devices will be able to deal with intranet information in the same way as Internet content because both are based upon HTML.

Following is a selection of WAP phones that have been announced recently:

WAP Enabled Phones on SALE
