Improvements in Windows Server 2012

The major Improvements on this version are as follows:

- It is ready to be integrated with cloud systems and it still can maintain the classic features of local datacenters as a result **Hyper-V Virtualization** has new features **Hyper-v replicas**, it allows you to create virtual machines replications between clusters and storage systems.

- The **Storage migration** virtual disks can be moved to different physical storages, Virtual machine snapshots, virtual machines can be deleted from the Hyper-v and also from the virtual disks and it can be used directly without the need to shut down the virtual machine.

- The **Core server installation** easily switches to GUI installation without the need of reinstallation.

- The file server and storage service improvement is that it eliminates identical copies in the same volumes as such and saves space.

- The **Storage pools and storage spaces** allows you to group the hard disks to one or more storage pools then it allows to create virtual disks. It can add other disks to the storage pools and make available to the users without impacting them.

- **The iSCSI Target Server** can offer block storage to other servers and applications on the network using the iSCSI standard.

- **Active Directory cloning** can deploy additional domain controllers by cloning an existing virtual domain controller.
The Windows Server 2012 has four editions: **Foundation, Essentials, Standard and Datacenter**. Each one of them has their own limitation accept the Datacenter version which is also the most expensive one.

The following table will show what is the right one for your business needs:

In this chapter, we will discuss regarding the requirements and prerequisites of the Windows Server 2012.

**System Requirements**

Although most of the servers nowadays probably have the necessary requirements for Windows Server 2012. It will certainly be useful to know them in case you want to upgrade from an older system.

The main requirements are:

- CPU socket minimum 1.4 GHz (64-bit processor) or faster for single core and Microsoft recommends is 3.1 GHz (64-bit processor) or faster multi-core.

- RAM memory minimum is 2GB, but Microsoft recommends 8GB.

- 160 GB hard disk with a 60 GB system partition space in your hard disk.

One important thing to note here is that the installation process itself will verify your computer hardware and let you know if it qualifies for a Windows Server 2012 installation. If not, then you will need to upgrade your hardware.

**Installation**

The following steps are to be adhered for the installation of Windows Server 2012.

**Step 1:** We can download the evaluation ISO of Windows Server 2012 R2 from the following link:

https://www.microsoft.com/en-us/evalcenter/evaluate-windows-server-2012-r2

But you will need to sign in first with a Microsoft account like Hotmail for example in order to complete the download and the good thing is that the evaluation period will last for 180 days, so you will have enough time to know if it will be the right product for you or not.

At the end, if you decide to buy the license of your Windows server 2012 R2. You can purchase it online via a Microsoft online store found in –
For the Enterprise solution, I would recommend to purchase it via a Microsoft partner that is found in your country.

Step 2: After downloading the ISO of Microsoft, create a boot USB driver which can be created with the Microsoft tool called Windows USB/DVD Download Tool and can be downloaded from the following link:

After downloading the EXE file, open it and select the ISO file location and then click next like in the following screenshot, and wait up to the end when the Boot USB is created.
Step 3: After completing the above given steps, plug-in the USB to the server and wait for a while till it loads the files. This will continue for about a couple of minutes as shown in the following screenshot.

Step 4: After the files are loaded, you will see the screen of language settings of installation, keyboard, time and currency format. Generally, all the default ones are also good enough to start with. Click Next.

Step 5: Click “Install now”.

Step 6: Once you have clicked on Install Now, the setup will start and it will load all the files and the screen will look as shown in the following screenshot.
Step 7: Wait until the files are loaded and then you will see the following screen. Let’s select Windows Server 2012 DataCenter Evaluation (Server with GUI) and click Next.

Step 8: Click “I accept the license terms” and then click on the Next button as shown in the following screenshot.
Step 9: The following screen will appear. In “Driver Options” you can create a new partition, delete or format the Hard disk. After you have done this process then you can select the partition where the Windows server 2012 R2 will be installed in our case we have one partition. Once all this is done, then click on Next.
**Step 10:** Let’s wait until this process finishes during this time and then the server will reboot.

![Windows Setup](image)

**Step 11:** Once the reboot is done the following screen will appear. Set the password for the server and then click on “Finish”.

![Settings](image)
Step 12: It will take some minutes until the setup finishes completely.

Step 13: Once all this is done, you have completed the installation process and the following screen will appear.

Congratulations!!!
Like the previous version, Windows Server 2012 has the following roles which can be used and in the subsequent chapter, we will see how to install and configure the most important ones.

The following picture shows all the roles. **A small reminder!** – Roles and Features are the tools that you need to install or activate in order to complete your IT Administration duties, without their installation you cannot do anything.

To add a role in the server we should adhere to the following steps:
**Step 1:** Click with the mouse on Server Manager which is found in the task bar as shown in the following screenshot.

**Step 2:** After opening the “Server Manager”, click on the second option “Add roles and features”.

**Step 3:** The following screen will appear, then you can Click on the Next button.
Step 4: Select the Role-based or feature-based installation and then click on the Next button.
In the next screen that appears, you will have the following two options:

**Option 1:** Select a server from the server pool. This option is – if you want to install the services in the physical server like being done in the following screenshot.
**Option 2:** Select a virtual Hard disk if you want to install the services in a virtual disk that can be somewhere in the network storage. Take a look at the following screenshot for better understanding.
Step 5: The last step will be to check the service that you want to install, but in the upcoming chapters we will continue this setup for each and every important services.
Windows PowerShell is a **command-line shell** and **scripting language** designed especially for system administration. It’s analogue in Linux is called as Bash Scripting. Built on the .NET Framework, Windows PowerShell helps IT professionals to control and automate the administration of the Windows operating system and applications that run on Windows Server environment.

Windows PowerShell commands, called **cmdlets**, let you manage the computers from the command line. Windows PowerShell providers let you access data stores, such as the Registry and Certificate Store, as easily as you access the file system.

In addition, Windows PowerShell has a rich expression parser and a fully developed scripting language. So in simple words you can complete all the tasks that you do with GUI and much more.

PowerShell Icon can be found in the task bar and in the start menu. Just by clicking on the icon, it will open.

To open it, just click on the icon and then the following screen will open and it means that PowerShell is ready for you to work on.
The latest version of PowerShell is 5.0 and to check what is installed in our server we type the following command – `$PSVersionTable` as shown in the following screenshot and from the screen we also know that we have PSVersion 4.0.
To update with the latest version where it has more Cmdlets we have to download **Windows Management Framework 5.0** from the following link –

**PowerShell ISE**

The Windows PowerShell Integrated Scripting Environment (ISE) is a host application for Windows PowerShell. In Windows PowerShell ISE, you can run commands and write, test, and debug scripts in a single Windows-based graphic user interface with multiline editing, tab completion, syntax coloring, selective execution, context-sensitive help, and support for right-to-left languages.

You can use menu items and keyboard shortcuts to perform many of the same tasks that you would perform in the Windows PowerShell console. For example, when you debug a script in the Windows PowerShell ISE, to set a line breakpoint in a script, right-click the line of code, and then click **Toggle Breakpoint**.
To open it you just go to Start – Search and then Type – PowerShell as shown in the following screenshot.

Then click on Windows PowerShell ISE. Or click on the downward Arrow as shown in the following screenshot.

It will list all the applications installed on the server and then click on Windows PowerShell ISE.
The following table will be open –

It has three sections, which include – The **PowerShell Console** with number 1, then **Scripting File** number 2 and the third is the **Command Module** where you can find the module.
